Many texts are excellent sources of knowledge about individual statistical tools, but the art of data analysis is about choosing and using multiple tools.

Instead of presenting isolated

techniques, this text emphasizes problem solving strategies that address the many issues arising when developing multivariable models using real data and not standard textbook examples. It includes imputation methods for

effectively,
methods for
dealing with
nonlinear
relationships and
for making the
estimation of
transformations a
formal part of the
modeling process,

From science fiction death rays to supermarket scanners, lasers have become deeply embedded in our daily lives and our culture. But in recent decades the standard laser beam has evolved

into an array of more specialized light beams with a variety of strange and counterintuitive properties. Some of them have the ability to reconstruct themselves after disruption by an obstacle, while others can bend in

complicated shapes or rotate like a corkscrew. These unusual optical effects open new and exciting possibilities for science and technology. For example, they make possible microscopic tractor beams that pull objects toward the

and they allow the
trapping and

even been found
that beams of light

can be tied in
knots. This book is
an introductory
survey of these
specialized light
beams and their
scientific
applications, at a
level suitable for

with a basic
knowledge of
