Describing new techniques and novel applications, Handbook of Research Methods in Public Administration, Second Edition demonstrates the use of tools designed to meet the increased complexity of problems in government and non-profit organizations with ever-more rigorous and systematic research. It presents detailed information on conceptualizing, planning, and implementing research projects involving a wide variety of available methodologies. Providing a reference of systematic research methods, this second edition explains how these techniques aid in understanding traditional issues, and reveals how they might be applied to answer emerging theoretical and practical questions. Following a linear, logical organization, this handbook meets systematic goals and objectives through eight groups of chapters. The first group explains the logic of inquiry and the practical problems of locating existing research. The second group deals with research design and the third examines pitfalls in measurement and data collection. The authors give practical, considered advice in the fourth section to anticipate and solve data management problems. They include numerous illustrations to supplement two separate sections devoted to basic and advanced quantitative analysis. The seventh section covers unique analytical techniques used to gain insight specific to the non-market sector's knotty problems. The final section addresses the impact of research and describes how to overcome illusive, tricky, and sizeable barriers to influence other researchers, decision makers, foundations, and grant making institutions. With a comprehensive survey of research methods and an examination of their practical and theoretical application in the past, present, and future, Handbook of Research Methods in Public Administration, Second Edition gives you the tools to make informed decisions.

For the first time in one volume, Phil Edmonston, Canada's automotive "Dr. Phil," covers all used vehicles, packing this guide with insider tips to help the consumer make the safest and cheapest choice possible from cars and trucks of the past 25 years.

"This report examines U.S. transportation's consumption of petroleum fuels and the public interest in reducing this consumption to enhance national energy security and help control emissions of carbon dioxide (CO₂) and other greenhouse gases (GHGs). Scientific analyses and models indicate a need to stabilize atmospheric concentrations of these gases by the middle of this century. Worldwide emissions reductions of up to 80 percent may be needed over the next four decades as a consequence. A response

by the transportation sector to this energy and emissions challenge will be important, because the sector accounts for more than two-thirds of the petroleum consumed in the United States and produces between one-quarter and one-third of all the CO₂ emissions attributable to the country's energy consumption. The report reviews policy options to bring about desired energy consumption and GHG emissions reductions from U.S. transportation over the next half century. It is not intended to model or quantify the impacts of each policy option over time but instead to examine the means by which each influences behavior and the demand for and supply of energy- and emissions-saving technology, particularly in the modes of transportation with the greatest effect on the sector's consumption of petroleum and emissions of GHGs. In choosing among policies, elected officials must take into account many factors that could not be examined in this study, such as the full range of safety, economic, and environmental implications of their choices; therefore, the report does not recommend a specific suite of policies to pursue. Instead, the emphasis is on assessing each policy approach with regard to its applicability across transportation modes and its ability to affect the total amount of energy-intensive transportation activity, the efficiency of transportation vehicles, and GHG emissions characteristics of the sector's energy supply. For each policy option, consideration is given to the challenges associated with implementation and with the production of large savings in energy and GHG emissions over a time span of decades."--pub. desc.

Discover the emerging science and engineering of System of Systems Many challenges of the twenty-first century, such as fossil fuel energy resources, require a new approach. The emergence of System of Systems (SoS) and System of Systems Engineering (SoSE) presents engineers and professionals with the potential for solving many of the challenges facing our world today. This groundbreaking book brings together the viewpoints of key global players in the field to not only define these challenges, but to

provide possible solutions. Each chapter has been contributed by an international expert, and topics covered include modeling, simulation, architecture, the emergence of SoS and SoSE, net-centricity, standards, management, and optimization, with various applications to defense, transportation, energy, the environment, healthcare, service industry, aerospace, robotics, infrastructure, and information technology. The book has been complemented with several case studies—Space Exploration, Future Energy Resources, Commercial Airlines Maintenance, Manufacturing Sector, Service Sector, Intelligent Transportation, Future Combat Missions, Global Earth Observation System of Systems project, and many more—to give readers an understanding of the real-world applications of this relatively new technology. System of Systems Engineering is an indispensable resource for aerospace and defense engineers and professionals in related fields.

The issues relating to the bullwhip effect have been studied rigorously in the past, even before the advent of supply chain management concepts. The bullwhip phenomenon refers to the increasing amplification of demand variation as one moves upstream in the supply chain. A variety of causes and resulting unfavorable performance effects in supply chains have been investigated, using wide-ranging methodologies. Many beneficial solutions have also been provided to counter bullwhip effects and improve overall supply chain performance. However, despite considerable research efforts in the past, the number of empirical studies conducted to date is rather limited. This study, consisting of three essays, is aimed at contributing to this body of literature. It is based on secondary data obtained from the U.S. automotive industry to test and investigate bullwhip effect-related issues. The automobile industry is considered due to availability of data, its important role in the economy, and dynamic business environment. The first essay is aimed at investigating individually: 1) the existence of bullwhip effect, 2) the impact of inaccurate demand process specification on bullwhip effect, 3) the effects of the demand forecasting policies on bullwhip effect, and, 4) demand-supply equilibrium at the product level, in selected U.S. automobile industry supply chain. The investigations were conducted using monthly sales, inventory and production data obtained from Automotive News: Market Databook, and Ward's Automotive Yearbook from 1990 to 2007 for a total of 216 observations. The automotive models considered were Ford Crown Victoria (Passenger car class), Ford Explorer (Sports-utility vehicle class), Ford Mustang (Sports car class), and Ford Ranger (Pick-up truck class). These four light-weight vehicle classes exhibit a wide range of demand patterns and demand volatility, and are sufficiently

representative of the industry. First, existence of the bullwhip effect was examined after defining and adopting suitable metrics for quantifying the bullwhip effect. The impact of demand process specification and forecasting policies were investigated by conducting several scenario-based experiments. The problem of model misspecification was examined by using univariate multiplicative seasonal ARIMA specification and other user-defined specifications. The effect of forecasting policies was investigated by evaluating the forecast accuracy and resulting bullwhip effects from several widely-used forecasting policies. The demand-supply equilibrium was tested through the estimation of various correlation and multiple regression coefficients. Multiple regression analysis was performed using widely-accepted balance equations, consisting of end-of-period inventory, beginning-of-period inventory, sales, and production in the supply chain. Equilibrium is confirmed if the parameter coefficients are statistically significant, and their signs consistent with theoretical stipulations. From these tests, it is concluded that, first, the bullwhip effects were present in the automobile supply chain. Second, it is found that mis-specified demand series may cause poorer forecast accuracies and stronger bullwhip effects. Third, the choice of forecasting policy is found to have an impact on forecast accuracy, and the use of relatively more complex forecasting techniques such as Holt-Winters and time series method (compared to moving average and simple exponential smoothing methods) leads to less pronounced bullwhip effects. Finally, pair-wise correlations among demand, production and inventory were significant, but the equilibrium status was not found to be present. This essay contributes to the field in the following ways. First, the results, confirming the existence of bullwhip effect in specific manufacturing supply chain, differs from the conclusions of studies such as Cachon et al. (2007) which was an aggregate industry-level study. Second, in contrast of the conclusions of studies such as Hosoda and Disney (2009), it was found that demand process misspecification has impacts on the bullwhip effect and the accuracy of demand forecasting. Finally, this study, to the author's best knowledge, is the first research work in the supply chain management field to test the existence of equilibrium conditions among demand, supply, and inventory. The second essay is aimed at investigating the relative forecasting accuracies of univariate and multivariate time series approaches to further examine whether multivariate time series methods are more effective than the simpler, univariate methods. In addition, this essay is aimed at evaluating causal relationships among demand, supply and inventory variables. Furthermore, extending Essay 1, this essay aims at re-investigating the existence of long-term

equilibrium between supply and demand in the supply chain since in-equilibrium condition may lead to serious inventory problems. This essay used the same dataset as used in Essay 1 which includes the monthly sales, monthly production, and monthly inventory for four selected Ford auto models during 1990 and 2007. ^The effectiveness of forecasting techniques between univariate and multivariate methods was examined by comparing the performance measures including forecast accuracy and bullwhip effect, resulting from the univariate ARIMA model used in Essay 1 and those from the vector autoregressive moving average model. Next, Granger causality test and impulse-response analysis were applied to test pair-wise causal relationships among demand, supply, and inventory. Then, the existence of equilibrium is examined using Johansen's cointegration test. Cointegration is a condition where multiple variables, driven by a common stochastic trend become stationary processes following linear combinations. If all considered variables in the multivariate model are stationary, it implies that all variables will be a fixed quantity in the long run. ^It is concluded that forecasting accuracies and the resulting bullwhip effect obtained from using multivariate time series methods do not necessarily outperform those from using univariate time series methods. Second, the causal relationship was examined between sales and production. However, the test of causal relationship involving inventory level was not conclusive. Finally, Johansen's test showed that the desired balanced system is not established. This essay contributes to the supply chain literature in the following aspects. First, multivariate time series model is introduced into the supply chain management field for the first time to investigate the forecast accuracy and test the relationship among the considered variables. The choice of univariate and multivariate forecasting methods was a major research target in the forecasting field. ^Second, although a few prior studies used the multivariate approach to describe the demand process, this study is the first to present the numerical results of the model specification and conduct forecasting based on the model. Third, this study is the first to investigate the causal relationships among demand, supply, and inventory using multivariate time series method. Finally, this study provides another effective and theoretically-robust tool to test the existence of equilibrium conditions in the supply chain. The major objective of the third essay is to describe the transition of different types of volatility in the supply chain. Extending Essay 2, this essay investigated the causal relationship among sales, supply, and inventory, and tested the existence of equilibrium between demand and supply in the supply chain. The data used in this study is the same as those used in Essay 1 and Essay 2. ^The study

applied multivariate generalized autoregressive conditional heteroscedasticity model to present a new, "volatility transition system" to empirically examine the existence of volatility. As for the problems about the causal relationship and equilibrium among demand, supply, and inventory in the supply chain, this study applied the same tests used in Essay 2, but, with the presence of volatility in the model. It is concluded that the volatility is transferable upwards and downward in the supply chain. The demand volatility was examined to influence the supply volatility and the volatility of supply chain inventory. Moreover, when the effect of volatility is included in the model, all three variables were tested to mutually influence one another. This finding is somewhat different from the result of Essay 2 which showed inconclusive causal relationship between inventory and the other two variables. Thus, the causal relationship and the interaction between inventory and supply and between inventory and demand were established in this essay when the effect of volatility is explicitly considered in the multivariate time series model. Finally, the results of equilibrium test confirmed the existence of a balanced system in the selected automobile supply chain among demand, supply, and inventory. This essay contributes to the literature in the several aspects. First, a multivariate generalized autoregressive heteroscedasticity model is used for the first time to empirically establish the existence of the volatility transition in the supply chain. Second, this study is also the first to consider the influence of a balanced demand-supply system where the demand, supply, and inventory are all stationary processes. The major contribution for this finding is that it is necessary to explicitly consider the effect of volatility when developing policies for supply chain inventory management in the presence of bullwhip effects.

Civilizations «narrate themselves» in order to establish legitimacy, succeed against others, portray their own merits to their best advantage. The results express societal

dynamics, yet also have a retroactive effect and decisively influence the self-conceptions of the «initiating societies». Political philosophies, interpretations of history and social perceptions of artistic achievements all contribute to these narratives. The dignified components, however, are by no means the sole or even the most important ones. Distinction in material culture (technological proficiency, popular art forms, etc.) or economic adroitness are even more consequential. The occidental narrative has been badly vacillating lately. Its severe crisis - due in part to a lack of collective self-confidence, but also to disagreements between its main strands - merits a meticulous analysis of a multitude of criteria. The resulting critique is embedded in reflections on a general theory of narrativity.
