**The interaction between land and sea is controlled by a number of processes that are in general driven by the equilibrium between environmental forcing components (e.g. hydrodynamic - waves, currents, surges), atmospheric (e.g. winds) and terrestrial (e.g. catchment land cover) and sediment dynamics. In the context of the Anthropocene epoch, the equilibrium in many coastal regions is now often altered by the influence of human activities. Successive human activities globally influence (indirectly) these forcing components, helping magnify the negative impact of extreme meteorological events and sea level rise. Directly, human activity can also influence a number of processes at a local scale within and between the catchment, the sea and the coast. For example, misplaced engineered infrastructure inside these naturally dynamic environments can accentuate disequilibrium, destabilizing shores and deltas. Development in catchments can promote rapid runoff, inducing sometimes-dramatic effects on downstream urbanized areas, the socio-economy as well as on coastal resources and ecosystems. This Research Topic aims to assemble research and review papers that focus on the dynamics of shores and deltas in peril under present conditions as well as in the future**

**A deeply reported personal investigation by a Miami journalist examines the present and future effects of climate change in the Magic City -- a watery harbinger for coastal cities worldwide. Miami, Florida, is likely to be entirely underwater by the end of this century.**

**Residents are already starting to see the effects of sea level rise today. From sunny day flooding caused by higher tides to a sewer system on the brink of total collapse, the city undeniably lives in a climate changed world. In Disposable City, Miami resident Mario Alejandro Ariza shows us not only what climate change looks like on the ground today, but also what Miami will look like 100 years from now, and how that future has been shaped by the city's racist past and present. As politicians continue to kick the can down the road and Miami becomes increasingly unlivable, real estate vultures and wealthy residents will be able to get out or move to higher ground, but the most vulnerable communities, disproportionately composed**

Miami may be on the front lines of climate change, but the battle it's fighting today is coming for the rest of the U.S. -- and the rest of the world -- far sooner than we could have imagined even a decade ago. Disposable City is a thoughtful portrait of both a vibrant city with a unique culture and the social, economic, and psychic costs of climate change that call us to act before it's too late.**

**No realm on Earth elicits thoughts of paradise more than the tropics. The tropical marine realm is special in myriad ways and for many reasons from seas of higher latitude, in housing iconic habitats such as coral reefs, snow white beaches, crystal clear waters, mangrove forests, extensive and rich seagrass meadows and expansive river deltas, such as the exemplar, the Amazon. But the tropics also has an even more complex side: tropical waters give rise to cyclones, hurricanes and typhoons, and unique oceanographic phenomena including the El Niño- Southern Oscillation which affects global climate patterns. Tropical Marine Ecology documents the structure**

**and function of tropical marine populations, communities, and ecosystems in relation to environmental factors including climate patterns and climate change, and patterns of oceanographic phenomena such as tides and currents and major oceanographic features, as well as chemical and geological drivers. The book focuses on estuarine, coastal, continental shelf and open ocean ecosystems. The first part of the book deals with the climate, physics, geology, and chemistry of the tropical marine environment. The second section focuses on the origins, diversity, biogeography, and the structure and distribution of tropical biota. The third part explores the rates and patterns of primary and secondary production, and their drivers, and the characteristics of pelagic and benthic food webs. The fourth part examines how humans are altering tropical ecosystems via unsustainable fisheries, the decline and loss of habitat and fragmentation, Further, pollution is altering an earth already in the throes of climate change. Tropical Marine Ecology is an authoritative and comprehensive introduction to tropical marine ecology for advanced undergraduate and postgraduate students. It is also a rich resource and reference work for researchers and professional managers in marine science. The aim of this Research Topic is to highlight recent advances in our knowledge of the pathways and controls of microbially-catalyzed hydrocarbon degradation in marine ecosystems, with emphasis on the response of microbial communities to the Deepwater Horizon oil spill in the Gulf of Mexico. In this Research Topic, we encouraged original research and reviews on the ecology of hydrocarbon-degrading bacteria, the rates and mechanisms of biodegradation, and the bioremediation of discharged oil under situ as well as near in situ conditions.**

**U.S. Emergency Management in the 21st Century: From Disaster to Catastrophe** explores a critical issue in American public policy: Are the current public sector emergency management systems sufficient to handle future disasters given the environmental and social changes underway? In this timely book, Claire B. Rubin and Susan L. Cutter focus on disaster recovery efforts, community resilience, and public policy issues of related to recent disasters and what they portend for the future. Beginning with the external societal forces influencing shifts in policy and practice, the next six chapters provide in-depth accounts of recent disasters— the Joplin, Tuscaloosa-Birmingham, and Moore tornadoes, Hurricanes Sandy, Harvey, Irma, Maria, and the California wildfires. The book concludes with a chapter on loss accounting and a summary chapter on what has gone right, what has gone wrong, and why the federal government may no longer be a reliable partner in emergency

The interface of 440,000 km long coastline in the world is subject to global change, with an increasing human pressure (land use, buildings, sand mining, dredging) and increasing population. Improving our knowledge on involved mechanisms and sediment transport processes, monitoring the evolution of sedimentary stocks and anticipating changes in littoral and coastal zones is essential for this purpose. The special issue of Water on "Sediment transport in coastal waters" gathers thirteen papers which introduce the current revolution in the scientific research related to coastal and littoral hydrosedimentary dynamics, and reflect the diversity of concerns on which research in

Explores the cultural politics of garbage in contemporary global society. *Garbage in Popular Culture* is the first book to explicitly link media discourse, consumer culture and the cultural politics of garbage in contemporary global society. It makes an original contribution to the areas of consumer culture studies, visual culture, media and communications, and cultural theory through a critical analysis of the ways in which waste and garbage are visually communicated in the public realm. Mehita Iqani examines three key themes evident in the global representation of garbage: questions of agency and activism, cultures of hedonism and luxury, and anxieties about devastation and its affect. Each theme is explored through a number of case studies, including zero-waste recycling campaigns communicated on Instagram, to fine art made with waste, popular entertainment festivals, tropical beach tourism, and films about oil spills and plastic waste in oceans. Iqani argues that we need a new vocabulary to think about what it means to be human in this new age of consumption-produced waste, and reflects on what

Details the ecology and wildlife of the continents, oceans, and poles, and includes up-to-date conservation and preservation data and the human impact on the world's ecosystems.

This book comprises selected proceedings of the Fourth International Conference in Ocean Engineering (ICOE2018), focusing on emerging opportunities and challenges in the field of ocean engineering and offshore structures. It includes state-of-the-art content from leading international experts, making it a valuable resource for researchers and practicing engineers alike.

The tropics is an area of enormous opportunity and potential. The countries situated between the Tropics of Cancer and Capricorn are largely developing in nature. There is huge interest in the types of business investments made in Southeast Asia, Central Africa, and the Amazonian tropical belts. These tropical regions continue to face opportunities and challenges in attracting foreign direct investments as well as the need to complement and/or compete with larger economies external to the tropics. This book provides an empirical assessment of the key sociocultural, economic, environmental, and political factors that influence the business dynamics of organizations operating within the tropics. It will address but is not limited to topics such as attracting businesses to the tropics,

facilitating smooth, stable conditions for business operations and sustainability, national institutions, and regulations that shape the way business is done, and the increasing deployment of new technologies and entrepreneurial innovations which are defining the global tropics as a distinct business region. It will offer readers a key focus for developing a deeper understanding of the factors and frameworks that influence and shape business activity in the area. While the primary audience for the book consists of academics and students from the fields of economics (environmental economics, developmental economics), business, international trade, tourism, and area studies, it will also provide a practical resource for government policy analysts wanting to fully appreciate some of the key economic and business issues facing the region.

of change that include climate change and globalization form the context for the diverse and interesting set of case studies from the region. The main conceptual grounds of the book cover sustainability, sustainable development goals (SDGs), responsibility, vulnerability, adaptation, resilience, governance, local development and inclusive growth. In this book sustainability is seen as one of the most important issues currently facing the tourism sector, affecting all types and scales of tourism operations and environments in the region. Tourism is an increasingly important economy in the southern African region and the industry is creating changes for communities and environment while also facing major challenges caused by global trends and changes. The book offers a case study driven approach to sustainability needs of tourism development in local community contexts. The case study chapters are linked through the book's focus on sustainable tourism and local community development. Through emphasizing the need to understand both global change and local contexts in sustainable tourism development, this book is a valuable resource for all those working in the field. This book contains a long-overdue treatment of the marine fish fauna of the region extending from the central Gulf of California, southward to Ecuador, including the offshore Revillagigedo, Cocos, and

advances in our science that warrant an

updating and revision of Sand and Sandstone.

The main framework of the first edition has

been retained so that the reader can begin

with the mineralogy and textural properties

of sands and sandstones, progress through

their organization and classification and

their study as a body of rock, to

consideration of their origin-provenance,

transportation, deposition, and lithification-

and finally to their place in the

stratigraphic column and the basin. The last

decade has seen the rise of facies analysis

based on a closer look at the stratigraphic

record and the recognition of characteristic

bedding sequences that are the signatures of

some geologic process-such as a prograding

shallow-water delta or the migration of a

point bar on an alluvial floodplain. The

environment of sand deposition is more

closely determined by its place in such

depositional systems than by criteria based

on textural characteristics-the "fingerprint" approach. Our revision reflects this change in thinking. As in the geological sciences as a whole, the concept of plate tectonics has required a rethinking of our older ideas about the origin and accumulation of sediments-especially the nature of the sedimentary basins.
