The previous volume,  
The Pathogenesis of

pathogenetic mechanisms, which in turn lead to still other cyclical feedback activities. Although influences from each of the three phenomenologic levels are at work during each stage of the clinical course, it would appear that social factors are most significant in the

early phase,  
psychological factors  
at the intermediate  
level, and biological  
ones toward the end.  
These differences are  
only relative,  
however, for  
influences of all three  
types surely are  
operative during all  
stages of the  
syndrome. This  
appears to be

particularly true for  
the biological  
parameters of activity.  
Don Goodwin (1976),  
who has supplied  
much of the data that  
support the role of  
hereditary factors in  
alcoholism, is wont to  
say that all living  
behavior is biological-  
by definition. The  
operational evidence  
for this is perhaps

more evident in alcoholism than in other syndromes. For example, the general social indifference of many Asians to alcohol may reflect the presence of an atypical isoenzyme of alcohol dehydrogenase rather than some independently derived cultural norm.

many new lines of
