Clearly organized and readable, this work is a good introduction to cost accounting for someone with little prior course work or experience in the field. Most chapters include a list of suggested readings, Good index. Most appropriate for community college or public library collections. Choice in response to the expanding roles of accountants in all types of organizations, cost accounting is becoming increasingly multidimensional, relying not only on traditional accounting principles, but also on behavioral, organizational, decisional, and other foundations. These conceptual foundations and their applications to cost accounting practices return to the basic foundations of accounting: a comprehensive review and interpretation of cost accounting techniques and theories. By treating both traditional and newer dimensions of the discipline, the book defines a new scope and boundary that presents cost accounting in a multidimensional framework. Ahmed Belkacem presents his material from three different perspectives. First, he shows how the fields of cost accounting, economics, behavioral science, operations research, statistics, and mathematics provide the tools as well as the concepts necessary for the classification, accumulation, and reporting of relevant data for internal decision making and for the interpretation and evaluation of resulting decisions. Second, he demonstrates how standard cost accounting techniques can be complemented by other possible approaches to problems, stressing not only the descriptive but also the normative solutions to cost accounting problems. Finally, he examines how cost accounting techniques affect the planning and control of routine and nonroutine decisions, inventory valuation and income determination. Among the major new developments addressed are variance analysis, learning phenomena in cost estimation, flexible manufacturing systems, and behavioral considerations in cost allocation. This work will be especially valuable for professional accountants and graduate students preparing for an accounting career, and an important resource for academic and public libraries.

With the growing integration of the international economy the international differences in financial reporting practices have never been so important in multinational business. Recent reforms in International Accounting Standards, combined with the continuing European harmonization, have placed this topic high on the current agenda of both researchers and of business analysts actively concerned with international accounting practice. This new, updated edition of Christopher Nobes' International Classification of Financial Reporting examines the causes and nature of the differences between financial reporting practices in different countries, charting all the many significant developments to have taken place through the 1980s. The relevant research published during this period is discussed, alongside the effects of the regulatory changes that have taken place. Improvements in the existing system of classification in financial reporting are proposed in the light of the accelerated process of harmonization currently taking place. The resulting volume is an indispensable source for academics and professionals in international accounting and for all who are engaged in the process of European harmonization.

This important, self-contained reference deals with structural life assessment (SLA) and structural health monitoring (SHM) in a combined form. SLA periodically evaluates the state and condition of a structural system and provides recommendations for possible maintenance actions or the end of structural service life. It is a diversified field and relies on the theories of fracture mechanics, fatigue damage process, and reliability theory. For common structures, their life assessment is not only governed by the theory of fracture mechanics and fatigue damage process, but by other factors such as corrosion, grounding, and sudden collision. On the other hand, SHM deals with the detection, prediction, and location of crack development online. Both SLA and SHM are combined in a unified and coherent treatment.

An examination of the economic analysis of the principles of accounting, this book shows that there are a number of questions for which appropriately constructed accounting data can give precise answers—whether there should be entry to or exit from an industry by a firm, for example, or whether or not a particular project should be undertaken. It not only highlights the importance of thinking clearly about the questions which are being answered with the use of accounting data; it also shows how accounts should be constructed in order to answer these questions. The authors address in particular two topical issues in accounting—the appropriate way to adjust accounts for inflation, and the appropriate treatment of deferred taxation in accounts—and provide an analysis of the precise corrections required for each.
