Reporting Standards, it might appear that classification is largely of historical interest, but this is not the case, for several reasons explained in this book. Christopher Nobes offers a critical analysis of the many previous accounting classifications, having drawn lessons from other fields of science and social science. Revised and updated to reflect the IFRS era, the book discusses how old classifications are reflected in today's international differences in practice under IFRS. It concludes with a discussion on the most useful classifications, and how classifications can still be relevant in the era of international standards. Accounting standards are an essential element in the regulation of current financial reporting. Standard setters promulgate such standards, and companies and professional accountants follow them in preparing financial reports. Although much has been written about the history of standard setting, the conceptual underpinnings of accounting standards, the process of setting them, and whether such standards should be 'rules-based' or 'principles-based,' there has been

little written about the kind of thing they are. This book examines the nature of accounting standards and the very idea of a rule, of implementation guidance, and of the objectives that are included in them. It enables the reader to grasp the reasons for promulgating standards, the role of the conceptual framework in setting standards in an institutional context, and the kind of rules that are useful in regulating financial reporting. The insights provided by this examination are used to throw light on the distinction between 'principles-based' and 'rules-based' standards and on the nature of 'good' accounting standards.'
