A cost function characterizes a firm's cost-minimizing behavior. It is defined as a function of the level of outputs produced and the prices of factors which enter the production process. Econometric estimation of a cost function allows one to test hypotheses regarding the structure of cost and the structure of the underlying technology. Cost function

structure is indicative of production structure, namely, the relationships among factors and products involved in the production process. In this study, the method of maximum likelihood is used to jointly estimate a cost function and labor share equation for a cooperative vegetable processing firm. The study concentrates on labor and energy inputs and on green beans, sweet corn, and an aggregate of other fruits and vegetables. Hypotheses of nonjointness in output prices (no factor substitutability) and nonjointness in inputs (no output complementarity), and a third hypothesis regarding regulation of raw product delivery quantities, are tested at the sample mean. Measures of conditional price elasticities of input demand, cost complementarity, and cost elasticity are derived from the estimated model.

A Study of Fruit and Vegetable Wholesaling and Jobbing Firms in New

York City

Background. Studies indicate that the vast majority of adult Americans do not regularly consume recommended daily servings of fruits and vegetables. One major issue with research in this area is how to measure fruit and vegetable intake, especially in ethnically diverse populations.

Although there are a wide range of health benefits to consuming fruits and vegetables, average Americans are not consuming the daily recommended amount, with rural populations consuming considerably fewer fruits and vegetables than the average population. This makes it crucial for research to be done on the rural populations so that targeted interventions can be created to increase their fruit and vegetable consumption, and in turn, their overall health. The current study evaluated the Theory of Planned Behavior (TPB) and Social Cognitive Theory (SCT) on fruit and vegetable consumption among individuals living in rural areas. A total of 118 rural participants completed the electronic survey; various correlation analyses were run among TPB and SCT constructs and the dependent variable and fruit and vegetable consumption; analyses included both a Pearson r correlation and regression analysis. Results indicated that while both theories (TPB and SCT) were significant predictors of fruit and vegetable consumption, perceived behavioral control accounted for the most variance in consumption within TPB and facilitation was the only significant predictor of consumption within SCT. Both theories indicated that internal constructs such as

attitude and self-efficacy were not significant; with control and access being the main factors for fruit and vegetable consumption. If this demographic has no control or access to fruit and vegetables, then other constructs such as their attitudes and confidence in eating them are less likely to predict consumption.

Consumers are advised to increase fruit and vegetable consumption, but the health effects of increased intake are not fully understood. This important collection brings together information on the health-promoting properties of fruit and vegetables. Introductory chapters provide an overview of fruit and vegetable bioactives and consumer attitudes towards fruit and vegetables. Part two discusses the health effects of fruit and vegetables in relation to specific diseases, including cancer, cardiovascular disease, diabetes, obesity and neurodegenerative diseases. The focus in Part three is on understanding fruit and vegetable phytochemicals. Chapters cover

physiological and ecological functions and biosynthesis of health-promoting compounds in fruit and vegetables, rapid analysis of phytochemicals in fruit and vegetables and clinical evidence for biological activity of fruit and vegetable phytochemicals. Part four chapters review the effect of pre- and post-harvest technologies on the health-promoting properties of fruit and vegetables. Topics covered include traditional breeding and modern processing techniques and their effect on fruit and vegetable phytochemicals; genetic manipulation of vegetable crops to alleviate diet-related diseases; agronomy and the nutritional quality of fruit; storage and handling of fruit and vegetables for optimal health-related quality and postharvest enhancement of bioactive compounds in fresh produce using abiotic stresses. The final chapters in Part five look at the nutritional quality of particular fruit and vegetable products, such as fresh-cut fruit and vegetables and organic fruit and vegetables. Improving the health-promoting properties of fruit and vegetable products is a valuable reference for those working in the fresh and processed fruit and vegetable sector of the food industry. Provides an overview of fruit and

vegetable bioactives Discusses the health effects of fruit and vegetables in relation to specific diseases Reviews the impact of agronomy, post-harvest treatments and processing on the nutritional quality of fresh fruit and vegetables

Fruit and Vegetable Phytochemicals: Chemistry, Nutritional Value and Stability provides scientists in the areas of food technology and nutrition with accessible and up-to-date information about the chemical nature, classification and analysis of the main phytochemicals present in fruits and vegetables – polyphenols and carotenoids. Special care is taken to analyze the health benefits of these compounds, their interaction with fiber, antioxidant and other biological activities, as well as the degradation processes that occur after harvest and minimal processing.

Currently, one in three of the world's population suffer from one or more forms of malnutrition. The Agricultural Development and Nutrition teams at the Bill & Melinda Gates Foundation, in collaboration with the UK's Department for International Development (FCDO), seek to investigate the potential of vegetable

and fruit supply chains to increase the supply of and strengthen demand for nutritious foods, as well as increase local market opportunities for increased income, especially for women. This report highlights the conclusions from literature review and data analysis, and identifies several issues and knowledge gaps that need further in-depth research during the second phase of this study. This secondary analysis identifies and describes the impact of self-reported barriers between purchasing produce at farmers markets and consuming that produce at home. This analysis also compares demographic characteristics between participants who did report barriers to fruit and vegetable consumption and those who did not. Finally, we examine differences in self-reported fruit and vegetable shopping behaviors and consumption between participants who did or did not report barriers, and compare these to the USDA 2010 Dietary Guidelines for Americans. This is a secondary analysis of data collected during an evaluation of the 2013 Fresh Bucks Program, a fruit and vegetable incentive program available at Seattle farmers markets. The original evaluation collected data from a convenience sample of Supplemental Nutrition Assistance Program (SNAP) participants who chose to participate in the Fresh Bucks Program. The Fresh Bucks evaluation surveyed participants at three time points: 1) before they shopped, 2) after they shopped on the same day, and 3) one-to-two months later

by phone. Our analysis used data collected from all three of the surveys. These three surveys asked questions related to the purchase, preparation, and consumption of fruits and vegetables. For this analysis, we divided participants into those who reported barriers to fruit and vegetable consumption and those who did not. Differences between the two groups were assessed with student-t and Fisher's exact tests. Barriers and solutions reported by participants were categorized and reported by themes. Of 70 participants, 35 did not report barriers and 35 did report at least one barrier. The most common barriers to full consumption of all produce were purchasing too much produce at once and that the produce spoiled before it could be eaten. Sixty-nine respondents indicated that they consumed more than half or all of their produce, and there was no statistically significant difference in full consumption of all produce those who reported some barriers and those who did not report barriers. The group that did not report barriers reported a significantly greater number of children per household ($p=0.02$), and were more likely to report that they knew how to prepare all items they purchased (p

Methods in Food Analysis Applied to Food Products deals with the principles and the acquired tools of food analysis, emphasizing fruit and vegetable products. The book explains the suitability and limitations of the analytical procedures used for food products, from polarimetry and saccharimetry to colorimetry, spectrophotometry, viscosimetry, acidimetry, and alcoholometry. This volume is organized into 20 chapters and begins with an overview of sampling and preparation and preservation of sample. Under the physical methods, the principles of the more common procedures are discussed together with their application to the analysis of fruit and vegetable products. A brief account of the nature of the products is included. In presenting the chemical methods, the salient chemical properties of the constituent are first considered, focusing on those properties used in analysis, which is then followed by an outline of the chemistry of several of the available methods. Finally a detailed description of one of the methods, usually as applied to fruit and vegetable products, is explained. Some references to microanalytical, bioassay and bacteriological procedures are made. This book is intended for food technologists, chemists, and manufacturers; students; and researchers involved in quantitative analyses; organic and inorganic chemistry; and bacteriology. The first handbook of its kind, giving in one volume, etailed information on both the analysis and quality control of fruit and vegetable products. Authoritative, need-based and up-to-date, the

Read PDF Analysis Of Fruit And Vegetable Juices For Their Acidity Project

book has been principally designed to meet the day-to-day requirements. Starting from the analysis of common constituents, the book covers methods of analysis of specific raw materials and containers used in processing measurement of different quality attributes, sensory evaluation, microbiological and microanalytical examinations, determination of thermal process time, and examination of specific fruit and vegetable products. The last few chapters are devoted to statistical quality control, preparation of standard solutions and tables required for day-to-day use.
