Originally published in 2000, The Arctic provides a comprehensive overview of the region's rapidly changing physical and human dimensions, and demonstrates the importance of communication between natural scientists, social scientists, and local stakeholders in response to the tremendous challenges and opportunities facing the Arctic. It is an essential resource for all Arctic researchers, particularly those developing multidisciplinary

projects. It provides an overview of key areas of Arctic research by renowned specialists in the field, and each chapter forms a detailed, varied and accessible account of current knowledge. Each author introduces the subject to a specialist readership, while retaining intellectual integrity and relevance for specialists. Overall, the richness of the material presented in this volume reflects the ecological and cultural diversity of this vast and environmentally critical part of the globe.

First published in 1985. Routledge is an imprint of Taylor & Francis, an informa company.

Human skeletons are widely studied in archaeological, anthropological and forensic settings to learn about the deceased. This book focusses on identified skeletal collections and discusses how and why collections were amassed and shows the vital role they play in improving methods and interpretations for archaeological and forensic research.

A synthetic treatment of the study of human remains from archaeological contexts for current and future generations of bioarchaeologists.

shortcomings in the traditional multivariate analysis of linear distances, angles, and indices. While there is much active research in the field, the new approaches to shape analysis are already making significant and ever-increasing contributions to biological research, including physical anthropology. *Modern Morphometrics in Physical Anthropology* highlights the basic machinery of the most important methods, while introducing novel extensions to these methods and illustrating how they provide enhanced results compared to more traditional approaches. *Modern Morphometrics in Physical Anthropology* provides a comprehensive sampling of the applications of modern, sophisticated methods of shape analysis in anthropology, and serves as a starting point for the exploration of these

This fascinating volume, assessing Lower and Middle Pleistocene African prehistory, argues that the onset of the Middle Stone Age marks the origins of landscape use patterns resembling those of modern human foragers. Inaugurating a paradigm shift in our understanding of modern human behavior, Grant McCall argues that this transition—related to the origins of “home base” residential site use—occurred in mosaic fashion over the course of hundreds of thousands

of years. He concludes by proposing a model of brain evolution driven by increasing subsistence diversity and intensity against the backdrop of larger populations and Pleistocene environmental unpredictability. McCall argues that human brain size did not arise to support the complex patterns of social behavior that pervade our lives today, but instead large human brains were co-opted for these purposes relatively late in prehistory, accounting for the striking archaeological record of the Upper Pleistocene.

rarely interact, including geneticists, evolutionists, physicians, ethologists, psychoanalysts, anthropologists, sociologists, theologians, historians, linguists, and philosophers. Genomic diversity is covered in several chapters dealing with biology, including the differences in men and apes and the genetic diversity of mankind. Top specialists, known for their open mind and broad knowledge have been carefully selected to cover each topic. The book is therefore at the crossroads between biology and human sciences, going beyond classical science in

the Popperian sense. The book is accessible not only to specialists, but also to students, professors, and the educated public. Glossaries of specialized terms and general public references help nonspecialists understand complex notions, with contributions avoiding technical jargon. Provides greater understanding of diversity and population structure and history, with crucial foundational knowledge needed to conduct research in a variety of fields, such as genetics and disease Includes three robust sections on biological, psychological,

and ethical aspects, with cross-fertilization and reciprocal references between the three sections. Contains contributions by leading experts in their respective fields working under the guidance of internationally recognized and highly respected editors. Far and away the market-leading text, Haviland's ANTHROPOLOGY, 9/e is the standard in the field. It offers a straightforward and thorough presentation of the principles and processes of anthropology, both physical and cultural, including ethnology, linguistics, and prehistoric archaeology. By integrating research and

ideas from several schools of thought, it reflects current scholarship and remains the most engaging text available due to its lively, accessible writing style and vivid illustrations.

Written by leading scholars in the field, this comprehensive and readable resource gives anthropology students a unique guide to the ideas, arguments and history of the discipline. The fully revised and expanded second edition reflects major changes in anthropology in the past decade.

Combining different sources of information, this volume contributes new

interpretations on

Mesoamerican head shaping traditions. Here, the head with its outer insignia was commonly used as a metaphor for designating the "self" and personhood and, as part of the body, served as a model for the indigenous universe. Analogously, the outer "looks" of the head and its anatomical constituents epitomized deeply embedded worldviews

and longstanding traditions. It is in this sense that this book explores both the quotidian roles and long-standing ideological connotations of cultural head modifications in Mesoamerica and beyond, setting new standards in the discussion of the scope, caveats, and future directions involved in this study. The systematic examination of Mesoamerican skeletal series fosters an explained review of indigenous cultural history through the lens of emblematic head models with their nuanced undercurrents of religious identity and ethnicity, social

organization and dynamic cultural shift. The embodied expressions of change are explored in different geocultural settings and epochs, being most visible in the centuries surrounding the Maya collapse and following the cultural clash implied by the European conquest. These glimpses on the Mesoamerican past through head practices are novel, as is the general treatment of methodology and theoretical frames. Although it is anchored in physical anthropology and archaeology (specifically bioarchaeology), this volume also integrates knowledge derived from anatomy and

human physiology, historical and iconographic sources, linguistics (polisemia) and ethnography. The scope of this work is rounded up by the transcription and interpretation of the many colonial eye witness accounts on indigenous head treatments in Mesoamerica and beyond.

Real understanding of past societies is not possible without including children, and yet they have been strangely invisible in the archaeological record. Compelling explanation about past societies cannot be achieved without including and investigating children and childhood. However marginal the traces of children's bodies and bricolage may seem compared to adults, archaeological evidence

of children and childhood can be found in the most astonishing places and spaces. The archaeology of childhood is one of the most exciting and challenging areas for new discovery about past societies. Children are part of every human society, but childhood is a cultural construct. Each society develops its own idea about what a childhood should be, what children can or should do, and how they are trained to take their place in the world. Children also play

a part in creating the archaeological record itself. In this volume, experts from around the world ask questions about childhood - thresholds of age and growth, childhood in the material culture, the death of children, and the intersection of the childhood and the social, economic, religious, and political worlds of societies in the past. This first volume in the series Trends in Biological Anthropology presents 11 papers. The

study of modern baboons as proxies to understand extinct hominin species' diet and the interpretation of skeletal degenerative joint disease on the skeletal remains of extant primates are presented as case studies using methods and standards usually applied to human remains. The methodological theme continues with an assessment of the implications for interpretation of different methods used to record Linear Enamel Hypoplasia

(LEH) and on the use and interpretation of three dimensional modeling to generate pictures of the content of collective graves. Three case studies on palaeopathology are presented. First is the analysis of a 5th-16th century skeletal collection from the Isle of May compared with one from medieval Scotland in an attempt to ascertain whether the former benefitted from a healing tradition. Study of a cranium found at Verteba

Cave, western Ukraine, provides a means to understand interpersonal interactions and burial ritual during the Trypillian culture. A series of skulls from Belgrade, Serbia, displays evidence for beheading. Two papers focus on the analysis disarticulated human remains at the Worcester Royal Infirmary and on Thomas Henry Huxley's early attempt to identify a specific individual through analysis of skeletal remains. The

concept and definition of 'perimortem' particularly within a Forensic Anthropology context are examined and the final paper presents a collaborative effort between historians, archaeologists, museum officers, medieval re-enactors and food scientists to encourage healthy eating among present day Britons by presenting the ill effects of certain dietary habits on the human skeleton. A compelling takedown of prevailing myths about

human behavior, updated and expanded to meet the current moment. There are three major myths of human nature: humans are divided into biological races; humans are naturally aggressive; and men and women are wholly different in behavior, desires, and wiring. Race, Monogamy, and Other Lies They Told You counters these pervasive and pernicious myths about human behavior. Agustín Fuentes tackles misconceptions about what race,

aggression, and sex really mean for humans, and incorporates an accessible understanding of culture, genetics, and evolution that requires us to dispose of notions of "nature or nurture."

Presenting scientific evidence from diverse fields, including anthropology, biology, and psychology, Fuentes devises a myth-busting toolkit to dismantle persistent fallacies about the validity of biological races, the innateness of aggression and violence,

and the nature of monogamy, sex, and gender. This revised and expanded edition provides up-to-date references, data, and analyses, and addresses new topics, including the popularity of home DNA testing kits and the lies behind "incel" culture; the resurgence of racist, nativist thinking and the internet's influence in promoting bad science; and a broader understanding of the diversity of sex and gender.

One of the founders of modern human biology and physical anthropology, Gabriel W. Lasker holds a well-established place in the history of science. In a classic article published in Science in 1969, Lasker advanced the idea of plasticity, the process of human adaptation to stressful environments by a series of modifications to the body during the course of physical growth and development. This concept was a factor that led the scientific

23 E

community to give up its reliance on the notion of genetically fixed racial types. As he documents the rapidly changing field of anthropology and some of its leading figures, Lasker gives his readers a peek inside the lives of people who have defined what it means to be human -- and one of those people is himself.

Experiences of a Biological

Anthropologist

Age is a complex cross-cutting notion for at least two reasons: the intricate interweaving of its biological and socio-cultural meanings and its dual significance as both a benchmark in an individual's life course and a

foundation for social structure. This book offers new perspectives on age and ageing by combining achievements in the biological sciences and their different applications and interpretations in demography, anthropology, psychology and other pertinent disciplines. Thirty contributors from these various fields revisit the measures and the biological models of ageing, the borderline between normal and pathological ageing, the pertinence of chronological age as a benchmark along the life course, its interrelations with psychological development, with reproductive phases and other life events, the «normalizing» role ascribed by age classes and the risk of falling into ageism, the cross-cultural diversity

and temporal changes of its meanings, the gender divide (real and perceived), as well as the rights that should be enjoyed at each age.

The determination of identity and the evaluation of trauma require special consideration when a body suffers extreme levels of damage sustained in a fire. Beginning with the search and recovery of the cremated remains (cremains) and the interpretation of the fire scene, the challenges and practicalities of recovering and analyzing burned remains demand a unique set of skills and expertise. This book provides a synopsis of these challenges and delineates, step-by-step, the recovery and interpretation of cremains from the point of discovery to the end of the analysis. Presenting

current research in forensic anthropology in a condensed, useable format, *Forensic Cremation: Recovery and Analysis* begins with an evaluation of the reasonable expectations for analyzing cremains in a forensic setting. It summarizes the contexts and challenges that face the professional and introduces a wide range of preservation encountered in a variety of fire contexts. The book discusses the capacity and mechanisms of fire to alter the chemical and physical properties of materials, particularly those of human tissues. It emphasizes a flexible approach to the collection of cremains, taking into consideration the intermixing of the human tissue with the surrounding materials. A significant portion of the book examines the

23 E

effects of fire on bone and the ability to determine trauma as peri- or post-mortem. It evaluates the practical use of dental tissue and DNA for identification and as an aid to the investigation. Providing crucial information on the handling of cremated remains in a forensic context, *Forensic Cremation: Recovery and Analysis* presents a methodical approach designed to maximize the potential of the evidence.
