Winner of the Virginia and Warren Stone Prize awarded annually by Harvard University Press for an outstanding book on education and society What makes a great teacher great? Who are the professors students remember long after graduation? This book, the conclusion of a fifteen-year study of nearly one hundred college teachers in a wide variety of fields and universities, offers valuable answers for all educators. The short answer is—it's not what teachers do, it's what they understand. Lesson plans and lecture notes matter less than the special way teachers comprehend the subject and value human learning. Whether historians or physicists, in El Paso or St. Paul, the best teachers know their subjects inside and out—but they also know how to engage and challenge students and to provoke impassioned responses. Most of all, they believe two things fervently: that teaching matters and that students can learn.

A Calculus text covering limits, derivatives and the basics of integration. This book contains numerous examples and illustrations to help make concepts clear. Calculus 3 finishes this series by covering parametric equations, polar coordinates, vector valued functions, multivariable functions and vector analysis. A free .pdf version of all three can be obtained at apexcalculus.com.

With this volume, the author demonstrates how a collective goods approach to higher education research can alleviate problems of rising costs, declining resources, and growing concerns about undergraduate learning. In taking this approach, the author presents new tools of analysis—borrowed from cognitive science, economics, data analytics, education technology and measurement science—to investigate higher education's place in society as a public or private good. By showing how these tools can be utilized to re-orient current research, this volume offers scholars and policy makers an argument for the large-scale use of scientific and economic approaches to higher education's most pressing issues.

The red corpuscles are like concave discs, whereas the white are irregular in shape like the amoeba. (1) he clotting of blood is caused by fibrin, a constituent of the plasma. Fibrin is a fluid while it is within the blood vessels, but when removed from the blood vessels it thickens to a jelly and the mass is known as a blood clot. (c) It provides a natural means of closing injured blood vessels and prevents excessive loss of blood through cuts or bruises. 160--(a) Describe the heart as to shape, size, location and function.
