*This book gives practical advice and ready to use tips on the design and construction of subsurface reservoir models. The design elements cover rock architecture, petrophysical property modelling, multi-scale data integration, upscaling and uncertainty analysis. Philip Ringrose and Mark Bentley share their experience, gained from over a hundred reservoir modelling studies in 25 countries covering clastic, carbonate and fractured reservoir types, and for a range of fluid systems - oil, gas and CO<sub>2</sub>, production and injection, and effects of different mobility ratios. The intimate relationship between geology and fluid flow is explored throughout, showing how the impact of fluid type, displacement mechanism and the subtleties of single- and multi-phase flow combine to influence reservoir model design. The second edition updates the existing sections and adds sections on the following topics: · A new chapter on modelling for CO<sub>2</sub> storage · A new chapter on modelling workflows · An extended chapter on fractured reservoir modelling · An extended chapter on multi-scale modelling · An extended chapter on the quantification of uncertainty · A revised section on the future of modelling based on recently published papers by the authors The main audience for this book is the community of applied geoscientists and engineers involved in understanding fluid flow in the subsurface: whether for the extraction of oil or gas or the injection of CO<sub>2</sub> or the subsurface storage of energy in general. We will always need to understand how fluids move in the subsurface and we will always require skills to model these quantitatively. The second edition of this reference book therefore aims to highlight the modelling skills developed for the current energy industry which will also be required for the energy transition of the future. The book is aimed at technical-professional practitioners in the energy industry and is also suitable for a range of Master's level courses in reservoir characterisation, modelling and engineering. · Provides practical advice and guidelines for users of 3D reservoir modelling packages · Gives advice on reservoir model design for the growing world-wide activity in subsurface reservoir modelling · Covers rock modelling, property modelling, upscaling, fluid flow and uncertainty handling · Encompasses clastic, carbonate and fractured reservoirs · Applies to multi-fluid cases and applications: hydrocarbons and CO<sub>2</sub>, production and storage; rewritten for use in the Energy Transition.*

"The ongoing COVID-19 pandemic marks the most significant, singular global disruption since World War II, with health, economic, political, and security implications that will ripple for years to come." -Global Trends 2040 (2021) Global Trends 2040-A More Contested World (2021), released by the US National Intelligence Council, is the latest report in its series of reports starting in 1997 about megatrends and the world's future. This report, strongly influenced by the COVID-19 pandemic, paints a bleak picture of the future and describes a contested, fragmented and turbulent world. It specifically discusses the four main trends that will shape tomorrow's world: - Demographics-by 2040, 1.4 billion people will be added mostly in Africa and South Asia. - Economics-increased government debt and concentrated economic power will escalate problems for the poor and middleclass. - Climate-a hotter world will increase water, food, and health insecurity. - Technology-the emergence of new technologies could both solve and cause problems for human life. Students of trends, policymakers, entrepreneurs, academics, journalists and anyone eager for a glimpse into the next decades, will find this report, with colored graphs, essential reading.

When Fiat entered rallying in 1970, its ultimate aim was to become World Rally Champion and the 131 Abarth of 1976-1980 provided the machinery to make that possible. It started winning World rallies within months of being launched, and in 1977, 1978 and 1980 the 'works' team also won the World Championship for Makes, and set every standard by which Rally Giants were to be judged. Was there ever any doubt that successors like the Lancia Rally 037 and the Delta Integrale would eventually come from the same stable?

Learn to make incredible horsepower from Ford's most powerful big-block engine design. For years, Ford relied on the venerable FE big-block engine design to power its passenger cars, trucks, and even muscle cars—and why not? The design was rugged, reliable, amortized, and a proven race winner at Le Mans and drag strips across the country. However, as is always the case with technology, time marches on, and Ford had a new design with many improvements in mind. Enter the 385 family of engines (also known as the "Lima" big-block). Produced from 1968–1998, the 385-series engines were used in multiple applications from industrial trucks to muscle cars and luxury cruisers. In Ford 429/460 Engines: How to Build Max Performance, which was written by Ford expert Jim Smart, all aspects of performance building are covered, including engine history and design, induction systems, cylinder heads, the valvetrain, camshaft selection, the engine block, and rotating assemblies. The best options, optimal parts matching, aftermarket versus factory parts, budget levels, and build levels are also examined. The 429/460 engines are a good platform for stroking, so that is covered here as well. Whether you want to build a torque-monster engine for your off-road F-150, a better-performing version of a 1970s-era smog motor for your luxury Lincoln, or an all-out high-horsepower mill for your muscle car, this book is a welcome addition to your performance library.
