'Electronics-I' is intended to be used as a text book for II Semester Diploma in Electrical and Electronics Engineering. The motivation for writing this book came when I felt the absence of a suitable text for Polytechnic students. This book is meant to fill the void. It is designed for comprehensively covering all topics relevant to the subject. Each and every topic has been explained in a very simple language as per the syllabus prescribed by the Board of Technical Education. To enhance the utility of the book, important points and review questions (Fill in the blank and descriptive type) have been included at the end of each chapter. Model question papers have been provided to help students prepare better for the semester examinations. It is hoped that this book will be of immense use to teachers and students of Polytechnics. Any constructive suggestions from teachers and students for improving the contents will be warmly appreciated.

This text and reference provides students and practicing engineers with an introduction to the classical methods of designing electrical circuits, but incorporates modern logic design techniques used in the latest microprocessors, microcontrollers, microcomputers, and various LSI components. The book provides a review of the classical methods e.g., the basic concepts of Boolean algebra, combinational logic and sequential logic procedures, before engaging in the practical design approach and the use of computer-aided tools. The book is enriched with numerous examples (and their solutions), over 500 illustrations, and includes a CD-ROM with simulations, additional figures, and third party software to illustrate the concepts discussed in the book.
