The human-animal bond has evolved and
diversified down the ages. Dogs, cats
and even horses, have long fulfilled the

role of faithful companion and indeed, as exemplified by the introduction of seeing and hearing dogs, there may be a critical level of co-dependency between the species. In the twenty-first century, the animal types that are kept as pets in many parts of the world are extensive ranging from reptiles through rodents to ruminants and beyond. As would be predicted by the nature of the relationship, the approach to treatment of a companion animal is often closely

aligned to that which would have been offered to their owner. However, an increasing awareness of welfare issues, such as the recognition that animals experience pain and the proven benefits of disease prevention in intensive farming units, together with the growth in zoos and wildlife parks, has increased the likelihood of food producing and non-domesticated animals receiving medicinal products during their life-time. Although many of the

individual drugs or classes of drugs administered to animals are the same as, or derived from, those given to man, the safe and effective use of drugs in animals often cannot be achieved by simply transposing knowledge of drug action on, or behaviour in, the body from one species to another. The impact of the anatomical, physiological and pathophysiological variability that spans the animal kingdom can often

- *“Clinical Controversies” in the treatment sections of disease-oriented chapters*

This is the golden age of cognitive therapy. Its popularity

among society and the professional community is growing by leaps and bounds. What is it and what are its limits? What is the fundamental nature of cognitive therapy? It is, to my way of thinking, simple but profound. To understand it, it is useful to think back to the history of behavior therapy, to the basic development made by Joseph Wolpe. In the 1950s, Wolpe astounded the therapeutic world and infuriated his colleagues by finding a simple cure for phobias. The psychoanalytic establishment held that phobias-irrational and intense fear of certain objects, such as cats-were just surface manifestations of deeper, underlying disorders. The psychoanalysts said their source was the buried fear in male children of castration by the father in retaliation for the son's lust for his mother. For females, this fear is directed toward the opposite

sex parent. The biomedical theorists, on the other hand, claimed that some as yet undiscovered disorder in brain chemistry must be the underlying problem. Both groups insisted that to treat only the patient's fear of cats would do no more good than it would to put rouge over measles. Wolpe, however, reasoned that irrational fear of something isn't just a symptom of a phobia; it is the whole phobia.

A Patient Focused Approach
100 Cases in Clinical Pharmacology, Therapeutics
and Prescribing explores scenarios commonly seen
by medical students and junior doctors in the ward,
emergency department, outpatient clinic or in
general practice in which an understanding of
pharmacology and sound prescribing practice is
central to successful clinical management and safe
patient care. A succinct summary of the patient's
history, examination and any initial investigations is
