the computer. What makes computer programs fast or slow? To answer this question, we have to get behind the abstractions of programming languages and look at how a computer really works. This book examines and explains a variety of scientific programming models (programming models relevant to scientists) with an emphasis on how programming constructs map to different parts of the computer's architecture. Two themes emerge: program speed and program

modularity. Throughout this book, the premise is to "get under the hood," and the discussion is tied to specific programs. The book digs into linkers, compilers, operating systems, and computer architecture to understand how the different parts of the computer interact with programs. It begins with a review of C/C++ and explanations of how libraries, linkers, and Makefiles work. Programming models covered include Pthreads, OpenMP, MPI, TCP/IP, and CUDA. The emphasis on how computers work leads the

reader into computer architecture and occasionally into the operating system kernel. The operating system studied is Linux, the preferred platform for scientific computing. Linux is also open source, which allows users to peer into its inner workings. A brief appendix provides a useful table of machines used to time programs. increasing levels of complexity up through CISC, network architecture, and parallel architecture. The authors have adopted the use of a SPARC-subset for an instructional ISA called "ARC" (A RISC Computer), which is carried through the mainstream of the book, and is complemented with platform-independent software tools that simulate the ARC ISA as well as the MIPS and x86 (Pentium) ISAs.

**FEATURES/BENEFITS** Choice of the instruction set architecture (ISA). The mainstream ISA "ARC" is a subset of the commercial SPARC, which strikes a balance between the complexity of a real-world architecture and the need for a simple instructional ISA.
