Several years ago a friendly looking young man walked into my office at the University Department of Dermatology in Cologne, introduced himself as a diplomate chemist, executive member of a family-owned, rather small German company manufacturing hair care products, and proposed to me straight forward to organize an international meeting on hair research. In view of the large number of new developments in the field something like this should be done after all, he said; he also promised to provide financial support. Such a meeting should be on the highest possible level, I said; and he agreed. I took the challenge and my visitor kept his promise. Three years later the First International Hair Congress was organized at the sophisticated new Congress Center in Hamburg, in which 630 participants from 36 countries were registered. After three and a half days of formal sessions, informal discussions, workshops and poster presentations our unanimous feeling was that this has been a most successful meeting. The young chemist was right. The idea was excellent. The growth and presence of hair and its distribution over the human body as a cosmetic attribute has become during the last two decades a matter of tremendous emotional significance. Hair can be rather easily formed according to one's sense of style, representing his personal image and his social feeling. If it becomes unacceptable or out of fashion, the hair style can be easily changed; the hair regrows as a biological requisite, without any additional cost.

o history of endocrinology can be written without reference N to Sir Humphry Davy Rolleston, whose monumental study of the subject appeared in 1936 under the modest subtitle: *The Endocrine Organs in Health and Disease with an Historical Review*. It was based on the author's Fitzpatrick Lectures at the Royal College of Physicians of London in 1933 and 1934. The lectureship, which dates from 1901, is devoted to the History of Medicine. Rolleston's work as regards scholarship and delivery cannot be surpassed and will remain the solid basis for any further study. It is of interest to note that Rolleston gave the Fitzpatrick Lectures when he was 71 years of age and had his book published when he was 74. By that time he had achieved most of his professional aims and all the honours a distinguished medical career can offer (see Section II). He perceived clearly that endocrinology was "an enormous subject in a most active stage of growth", which "recently has received most valuable help from organic chemists, who have devoted much time to the elucidation of the structure, isolation and synthesis of the hormones". He remarked that the knowledge of endocrinology was expanding with extreme rapidity, and it has been suggested that in this respect it would appear to be itself influenced by a growth hormone. He continued: "Before 1890 there were comparatively few publications dealing with the ductless glands, but in 1913, A.

Increased life expectancy and the ageing of the population have been the subject of attention in Western countries, and particularly in Europe, for some years now. The challenge of 'squaring the circle' between ends and means - as well as between personal aspirations and systemic constraints - in health and social care continues to be a major concern for policymakers and all those involved in the delivery of services. This book, Active Ageing and Healthy Living: A Human Centered Approach in Research and Innovation as Source of Quality of Life, presents the results of a number of research projects from the Università Cattolica del Sacro Cuore - the largest private university in Italy and in Europe - with a strong commitment to the areas of medicine and health sciences, economics, business, international relations, political science, psychology and communications. Visions and research directions for the future are also presented and discussed. The introduction to the book addresses the challenges posed by an increasingly ageing population and the way in which multidisciplinary research can contribute to positive outcomes. The remainder of the book is divided into two sections. The first proposes promising research directions for future focus, and includes papers on demographic change; frailty in the elderly; the role of diet in healthy ageing; active ageing; and positive technology. The second section deals with recent developments in research into active ageing and healthy living (AA&HL). It addresses numerous topics, including: mechanisms to shift the balance from unhealthy to healthy ageing; nutrition; the role of ICTs for older people; work, retirement and health; and empowering skills for AA&HL.

Urticaria is one of the most common diseases in dermatology and allergy. Unlike many other diseases, the fleeting nature of the wheals makes first diagnosis by both patients and physicians in many cases easy. However, this only refers to the ordinary wheals. The disease itself is highly complex in nature, with variety of clinical manifestations ranging from pinpoint-sized wheals to extensive angioedema. Complexity is also seen in the diversity of possible eliciting factors, the many different clinical subtypes and the therapeutic responsiveness. Only in recent years has a better understanding of the diversity in the different subtypes led to new classifications and new evidence-based guidelines for diagnostics and management of the disease. While mast cells are in the center of most urticaria reactions, it is now clearly understood that the responsible mediators are not only limited to histamines. The current book appears in a series of books by Springer. In 1986, the first monograph was edited by Professor Henz née Chanewsky. Since then, two updates of the book have appeared in the German language with Professor Henz as first editor and T. Zuberbier, J. Grabbe, and E. Monroe as the co-editors of the most recent English version, published in 1998. All these books have been written as a joint effort of Professor Henz together with her team at the Department of Dermatology at the Virchow Clinic, Humboldt University, Berlin.

Ball milling has emerged as a powerful tool over the past few years for effecting chemical reactions by mechanical energy. Allowing a variety of reactions to occur at ambient temperatures and in solvent-free conditions, ball milling presents a greener route for many chemical processes. Compared to the use of microwave and ultrasound as energy sources for chemical reactions, ball milling is not as familiar to chemists and yet it holds great potential. This book will introduce practicing chemists to the technique and will highlight its importance for green transformations. Current applications of ball milling will be covered in detail as well as its origin, recent developments and future scope, challenges and prospects. Chemical transformations covered include carbon-carbon and carbon-heteroatom bond formation, oxidation by solid oxidants, asymmetric organo-catalytic reactions, dehydrogenative coupling, peptide syntheses and polymeric material syntheses. The book will provide a valuable guide for organic, inorganic and organometallic chemists, material scientists, polymer scientists, reaction engineers and postgraduate students in chemistry.

"...Dr. Holick says, sunshine is good medicine." Jane E. Brody, The New York Times Sunshine is good for you! While too much sun causes wrinkles and raises other health concerns, a lack of sun exposure, our primary source of vitamin D can cause serious health problems, such as osteoporosis, certain cancers, and diabetes. Dr. Holick, the discoverer of the active form of vitamin D, has pulled together an impressive body of evidence in support that no one should be—as he puts it—a “sunphobe,” or, for that matter, a sun worshipper. His conclusion: relatively brief, but unfettered exposure to sunshine and its equivalent can help to ward off a host of debilitating and sometimes deadly diseases, including osteoporosis, cancers of the colon, prostate and breast, hypertension, diabetes, multiple sclerosis, rheumatoid arthritis, and depression.

This readable guide to the assessment and management of patients with bipolar disorder can help physicians keep abreast of dramatic and rapid advances of recent years and integrate them into clinical practice. Handbook of Diagnosis and Treatment of Bipolar Disorders emphasizes recent controlled studies and FDA-approved indications and translates these data into the real world of clinical practice. The contributions of the eleven chapter authors from Stanford University reflect more than a decade of clinical research and treatment undertaken at that institution, including advanced interventions supported by controlled studies. They provide crucial information regarding diagnosis, pharmacotherapy, psychotherapy, and treatment of patients from special populations: women, and older adults -- and patients with particular challenging illness course such as rapid cycling. This is the first book to provide quantitative assessment of potential benefit vs. risk (number needed to harm) for all approved treatments for bipolar disorder, providing clinicians with information needed to balance benefits and risks in order to render individualized, evidence-based care. It describes all FDA-approved indications -- reviewing efficacy, safety, tolerability, pharmacokinetics, illness phase-specific dosing, and drug interactions. A chapter on treatment strategy explains crucial illness transition points and describes how these have been integrated with knowledge of illness phase in mood disorders. The book then demonstrates a new approach to therapeutics by providing: An overview of pharmacotherapy that covers the emergence of evidence-based pharmacotherapy and number-needed-to-treat and -harm analysis for managing acute manic and mixed episodes that include evidence-based assessments of lithium, divalproex, carbamazepine, and second-generation antipsychotics. Coverage of acute and chronic bipolar disorders that outlines four tiers of treatment for this most pervasive illness phase with the fewest approved treatments. Discussion of the longer-term management of bipolar disorder based on results of controlled trials of recently approved pharmacotherapies such as lamotrigine, olanzapine, aripiprazole, and adjunctive quetiapine. A review of the use of mood stabilizers and second-generation antipsychotics, often in combinations, as well as the controversial role of adjunctive antidepressants in treating patients with rapid-cycling bipolar disorders. Description of important evidence-based adjunctive psychotherapeutic interventions in bipolar depression, and bipolar maintenance treatment. Comprehensive in scope, yet readily accessible for application to clinical practice. Includes summary tables, quick-reference lists of clinical pearls, and case studies to make its content more relevant. Handbook of Diagnosis and Treatment of Bipolar Disorders is the ideal source for the latest research into everyday practice.
