trafficked in third-world countries. His story includes the rescue and his eventual adoption of two young siblings--Mia and Marky, who were born in Haiti. Section 2 features the lives of five abolitionists, a mix of heroes from past to present, who call us to action and teach us life lessons based on their own experiences:

Therefore, this book looks at research topics dealing with isolation, purification, and identification of active ingredients of essential oils from plants. This knowledge will provide significant information about essential oils to

Laboratory Methods in  
Microbiology is a  
laboratory manual based  
on the experience of the  
authors over several  
years in devising and  
organizing practical  
classes in microbiology  
to meet the requirements  
of students following  
courses in microbiology

Agricultural College.

The primary object of the manual is to provide a laboratory handbook for use by students following food science, dairying, agriculture and allied courses to degree and diploma level, in addition to being of value to students reading microbiology or general bacteriology. It is hoped that laboratory

workers in the food manufacturing and dairying industries will find the book useful in the microbiological aspects of quality control and production development. The book is organized into two parts. Part I is concerned with basic methods in microbiology and would normally form the basis of a first year course.

Abbreviated recipes and formulations for a number of typical media and reagents are included where appropriate, so that the principles involved are more readily apparent. Part II consists of an extension of these basic methods into microbiology as applied in the food manufacturing, dairying

and allied industries. In this part, the methods in current use are given in addition to, or in place of, the "classical" or conventional techniques.

of chlorine dioxide, but also contains environmental information. The health effects and environmental fate and effects of chlorine dioxide used in the treatment of drinking-water, together with

those of halogenated organics produced by the interaction between the disinfectant and other materials present in the water are covered in a recent Environmental Health Criteria publication (EHC

No. 216 2000)  
and are not dealt  
with in detail here.  
Chlorine dioxide is  
an irritant and it  
seems likely that  
health effects  
would be  
restricted to local  
responses. The  
few ecotoxicity  
data available  
show that chlorine

dioxide can be highly toxic to aquatic organisms. The development of suitable assays, the integration of appropriate technology, and the effective management of the essential infrastructure are all critical to the

success of any high-throughput screening (HTS) endeavor.

However, few scientists have the multidisciplinary experience needed to control all aspects of an HTS drug discovery project.
