

Deposition Of Holland Thin Films Vacuum Wordpress

In **Bronze Age Europe, an enormous amount of metalwork was buried in the ground and never retrieved. Patterns in the archaeological finds show that this was a deliberate practice: people systematically deposited valuable metal objects in specific places in the landscape, even in non-metalliferous regions. Although this practice seems strange and puzzling from our modern perspective, these patterns demonstrate that it was not simply a matter of irrational human behaviour. Instead, there were supra-regionally shared ideas and conventions behind this practice.This book aims to acquire a better understanding of these ideas and conventions. By systematically investigating the objects and places that people selected for metalwork depositions, the logic behind the practice of selective metalwork deposition is unravelled. This research focuses specifically on the emergence of the practice in Denmark, northern Germany, and the Netherlands, a region without sources of copper and tin that has not been studied as a whole before, despite striking similarities in the archaeological record. Starting from the first introduction of metal to the research area, the emergence and development of selective metalwork depositions is examined and followed over time. For thousands of years, deliberately depositing metal objects in the landscape was a completely normal thing to do. We are now beginning to catch a glimpse of the logic behind this human behaviour. This research does not only add a new chronological and geographical depth to the field of metalwork depositions, but it also provides a detailed catalogue of the metalwork from the research area.**

Dry Deposition of SO2 Over Grassland and Heather Vegetation in The Netherlands

A Case Study of the Waal River by Nijmegen

Channel deposits from meandering rivers have proven to be far more complex than the well-known lithofacies model consisting of sandy channel, gravelly channel-lag, and silty overbank deposits. This is especially relevant for sharp bends in rivers, which are subject to different meander behaviour than bends with lower curvatures; sharp bends are instead often accompanied by zones of flow separation which enable deposition of sediment in the outer bend. This phenomenon is known as counterpoint deposition, forming counterpoint bars. In this research, the scroll bar morphology associated with a sharp bend in the Waal river near Nijmegen is investigated for the potential that counterpoint deposits are present, as opposed to the current paleogeographic reconstruction that considers these deposits to be part of a point bar complex.

Atmospheric Deposition

This document is a deposition written on November 27, 1838, on the information given by J.W. King. G.W. Hayes, Justice of the Peace for Haywood County, North Carolina took the deposition. The deposition discussed the clothing, provisions, and money that William Holland Thomas provided the Cherokees. King was a clerk in William Thomas' store and witnessed Thomas giving these supplies to the Cherokees. The deposition was witnessed and notarized by Robert Love and James Graham, both of which stated their belief in the credibility of King's character.

Effects of Acid Deposition on 150 Forest Stands in The Netherlands

Vacuum Deposition of Thin Films

This book contains the results and conclusions of extensive research on the causes and effects of acidification of forests/forest soils and heathland in the Netherlands. In 1985 the Dutch Priority Programme on Acidification was started in order to give a more concrete form to the increasing interest of policy-makers in the effects of air pollution on ecosystems in particular. In the last three years, the research has focused on obtaining a more accurate estimate of the emission of ammonia on the deposition of SOx, NOy and NHx, and also on quantifying effects on forest and heathland ecosystems. This quantification of effects included experimental work model analyses, and derivation of critical loads and levels for forest and heathland ecosystems. Furthermore, scenario analyses were made with the Dutch Acidification Systems Model (DAS) in order to evaluate the effectiveness of policy measures. The research itself, which formed the basis for this book, has been described in the reports on individual projects. A summary of the scientific results and conclusions is given in thematic reports (added as annex). An independent Review Team has provided a critical assessment of the research carried out since 1988. The Review Report has been incorporated as annex.

War, Terror, and the Rule of Law in the Dutch Revolt

Treason in the Northern Quarter

In the spring of 1575, Holland's Northern Quarter--the waterlogged peninsula stretching from Amsterdam to the North Sea--was threatened with imminent invasion by the Spanish army. Since the outbreak of the Dutch Revolt a few years earlier, the Spanish had repeatedly failed to expel the rebels under William of Orange from this remote region, and now there were rumors that the war-weary population harbored traitors conspiring to help the Spanish invade. In response, rebel leaders arrested a number of vagrants and peasants, put them on the rack, and brutally tortured them until they confessed and named their principals--a witch-hunt that eventually led to a young Catholic lawyer named Jan Jeroenszoon. Treason in the Northern Quarter tells how Jan Jeroenszoon, through great personal courage and faith in the rule of law, managed to survive gruesome torture and vindicate himself by successfully arguing at trial that the authorities remained subject to the law even in times of war. Henk van Nierop uses Jan Jeroenszoon's exceptional story to give the first account of the Dutch Revolt from the point of view of its ordinary victims--town burghers, fugitive Catholic clergy, peasants, and vagabonds. For them the Dutch Revolt was not a heroic struggle for national liberation but an ordinary dirty war, something to be survived, not won. An enthralling account of an unsuspected story with surprising modern resonance, Treason in the Northern Quarter presents a new image of the Dutch Revolt, one that will fascinate anyone interested in the nature of revolution and civil war or the fate of law during wartime.

Critical Deposition Levels for Nitrogen and Sulphus on Dutch Forest Ecosystems

In this book the research on atmospheric deposition of the Dutch Priority Programme on Acidification Research is summarised. Although most research described is of Dutch origin, it has been put into a broader perspective by outlining the state of knowledge on the process affecting atmospheric deposition in Europe. This has resulted in detailed deposition maps for the Netherlands and Europe. The volume is intended for those who measure or model atmospheric deposition and ecologists interested in exposure from

Proceedings of the International Conference "Thin Film Deposition of Oxide Multilayers. Industrial-scale Processing"

Deposition of Coversand and Loess in the Netherlands

The book begins with an overview of the research topics which were addressed in the three different phases of the Dutch Priority Program on Acidification (DPPA), executed between 1985 and 1994. This chapter is followed by a chapter which deals with the emissions of acidifying substances, the concentrations and the deposition to forest and nature conservation areas. Prognoses are given for the acid deposition in 2000 and 2010; the deposition in the countries surrounding the Netherlands is also mentioned. The differences in the results of the DPPA-II are analysed. The third chapter deals with the effects of exposure and load on forests. The chapter moves from small-scale to large-scale: first the effects in laboratory-scale studies are described, then the effects in the field, both at stand level and on a regional scale. In addition, the critical thresholds (critical level of concentration and critical load of deposition) are discussed. The fourth chapter covers terrestrial ecosystems (or parts thereof) as well as weakly buffered surface waters, springs and other streams. Critical levels and loads are also discussed. The most important results are given in chapter 5. In the appendices of the book, so-called umbrella theme reports on deposition, stand modelling and effects on forests are presented which describe in more detail the scientific work performed in the third phase of the DPPA. This book will be of interest to anyone involved in research related to acidification and eutrophication; i.e., not only those who perform the research in the causal chain from emissions to effects, but also policy-makers and students.

Papers, 1664, Dutch West India Company Vs. Robert Downman

Deposition of J.W. King, 1838 Nov. 27, Haywood County, N[orth]C[arolina].

Review on the Scientific Underpinning of Calculation of Ammonia Emission and Deposition in the Netherlands

Papers were copied by N.P. Howard, clerk of the General Court of Virginia, 1847 Sept[embe]r 22. Papers include Downman's letter of patent from Alfonso VI. King of Portugal to captain the ship "Mary" and his deposition, answer, bonds and promise; letters authorizing Johannes De Decker and Nicolaes Varieth to act as agents for the Dutch West India Company; deposition of Paulus Heytridder (captain of the ship "The Arms of Amsterdam"); letters and extracts of letters between Sir William Berkeley, Peter Stuyvesant and the Council of Virginia (concerning payment for a horse); depositions of William Mann and Jeffrey Waller (concerning the ship "The Merchant's Delight") and the decision of the General Court to send the case to the High Court of Admiralty.
