This paper explores the role of export costs in the process of poverty reduction in rural Africa. We claim that the marketing costs that emerge when the commercialization of export crops requires intermediaries can lead to lower participation into export cropping and, thus, to higher poverty. We test the model using data from the Uganda National Household Survey. We show that: i) farmers living in villages with fewer outlets for sales of agricultural exports are likely to be poorer than farmers residing in market-endowed villages; ii) market availability leads to increased household participation in export cropping (coffee, tea, cotton, fruits); iii) households engaged in export cropping are less likely to be poor than subsistence-based households. We conclude that the availability of markets for agricultural export crops help realize the gains from trade. This result uncovers the role of complementary factors that provide market access and reduce marketing costs as key building blocks in the link between the gains from export opportunities and the poor.

Today I'm going to visit my Grammy. I'm not going to her house. She doesn't live there now. She had to move. I miss baking with Grammy. I miss reading with Grammy. I miss Grammy's toy basket and playing games with her. I miss the way she smiled when she saw me. But there are lots of things she forgets. She drove to the store and got lost on the way home. That's why Grammy moved. She gets mixed up, and sometimes it makes her mad, and sometimes it makes her cry. Mama said Grammy's sickness means she can't be the person she used to be, but that doesn't mean she's forgotten that she loves us. Analysis of Financial Data teaches the basic methods and techniques of data analysis to finance students, by showing them how to apply such techniques in the context of real-world empirical problems. Adopting a largely non-mathematical approach Analysis of Financial Data relies more on verbal intuition and graphical methods for understanding. Key features include: Coverage of many of the major tools used by the financial economist e.g. correlation, regression, time series analysis and methods for analyzing financial volatility. Extensive use of real data examples, which involves readers in hands-on computer work. Mathematical techniques at a level suited to MBA students and undergraduates taking a first course in the topic. This is the authoritative collection of the writings of Dr. Edward I. Altman, the world's leading authority on bankruptcy, corporate distress, and defaults, and creator of the widely-used Z-Score model. This book contains both classic and never-before-published articles, along with Altman's comprehensive introduction that places all the articles in context.

These reports cover the supply, demand, and price situation every week on a regional, national, and international basis for milk, butter, cheese, and dry and fluid products.

This manual draws on the ILO's comprehensive database containing the principal legal provisions and minimum wage fixing mechanisms in 100 countries. The minimum wage has had a long and turbulent history, and this study sheds light on its intricacies by providing a thorough overview of the institutions and practices in different countries. It outlines the main topics for debate concerning the effects of minimum wages on major social and economic variables such as employment, wage inequality, and poverty. The book considers the various procedures countries use for implementation, including the criteria employed to fix the minimum wage, and how they are linked to specific country objectives. It then measures the efficiency of the minimum wage, and focuses on its impact on employment as a major political issue. For the benefit of non-specialists, the validity of econometric models and their results are examined.

INTRODUCTORY ECONOMETRICS: A MODERN APPROACH, 4e International Edition illustrates how empirical researchers think about and apply

econometric methods in real-world practice. The text's unique approach reflects the fact that undergraduate econometrics has moved beyond just a set of abstract tools to being genuinely useful for answering questions in business, policy evaluation, and forecasting environments. The systematic approach, which reduces clutter by introducing assumptions only as they are needed, makes absorbing the material easier and leads to better econometric practices. Its unique organization separates topics by the kinds of data being analyzed, leading to an appreciation for the important issues that arise in drawing conclusions from the different kinds of data economists use. Packed with relevant applications, INTRODUCTORY ECONOMETRICS offers a wealth of interesting data sets that can be used to reproduce the examples in the text or as the starting point for original research projects.

This book serves as a comprehensive source of asymptotic results for econometric models with deterministic exogenous regressors. Such regressors include linear (more generally, piece-wise polynomial) trends, seasonally oscillating functions, and slowly varying functions including logarithmic trends, as well as some specifications of spatial matrices in the theory of spatial models. The book begins with central limit theorems (CLTs) for weighted sums of short memory linear processes. This part contains the analysis of certain operators in L_p spaces and their employment in the derivation of CLTs. The applications of CLTs are to the asymptotic distribution of various estimators for several econometric models. Among the models discussed are static linear models with slowly varying regressors, spatial models, time series autoregressions, and two nonlinear models (binary logit model and nonlinear model whose linearization contains slowly varying regressors). The estimation procedures include ordinary and nonlinear least squares, maximum likelihood, and method of moments. Additional topical coverage includes an introduction to operators, probabilities, and linear models; L_p -approximable sequences of vectors; convergence of linear and quadratic forms; regressions with slowly varying regressors; spatial models; convergence; nonlinear models; and tools for vector autoregressions.

The Oxford Handbook of Pricing Management is a comprehensive guide to the theory and practice of pricing across industries, environments, and methodologies. The Handbook illustrates the wide variety of pricing approaches that are used in different industries. It also covers the diverse range of methodologies that are needed to support pricing decisions across these different industries. It includes more than 30 chapters written by pricing leaders from industry, consulting, and academia. It explains how pricing is actually performed in a range of industries, from airlines and internet advertising to electric power and health care. The volume covers the fundamental principles of pricing, such as price theory in economics, models of consumer demand, game theory, and behavioural issues in pricing, as well as specific pricing tactics such as customized pricing, nonlinear pricing, dynamic pricing, sales promotions, markdown management, revenue management, and auction pricing. In addition, there are articles on the key issues involved in structuring and managing a pricing organization, setting a global pricing strategy, and pricing in business-to-business settings.

We show the importance of a dynamic aggregation bias in accounting for the PPP puzzle. We prove that established time-series and panel methods substantially exaggerate the persistence of real exchange rates because of heterogeneity in the dynamics of disaggregated relative prices. When heterogeneity is properly taken into account, estimates of the real exchange rate half-life fall dramatically, to little more than one year, or significantly below Rogoff's "consensus view" of three to five years. We show that corrected estimates are consistent with plausible nominal rigidities, thus, arguably, solving the PPP puzzle.

Rural poverty is a widespread phenomenon in sub-Saharan Africa. While most farmers produce for home consumption, some are engaged in high-value export agriculture crops and changes in export prices and in the conditions faced in export markets (both internally and externally) can therefore play a big role in shaping poverty in a region. Traditionally, the literature has focused on how external conditions affect poverty. By contrast, this unique and timely book breaks new ground by exploring domestic factors. In particular, the authors investigate the role played by the structure of competition in export agriculture supply chains. Combining theory with detailed empirical analyses of the cotton, coffee, tobacco, and cocoa sectors in eight sub-Saharan countries, the book reveals important new insights. While there is much variation within and between countries and crops, the authors show conclusively that measures to increase

*competition in export agriculture supply chains can be just as significant as external factors such as subsidies, quotas, and tariffs - and that these measures can have worthwhile effects on poverty reduction in the exporting countries. ***** "The last two decades' reforms in Africa's agricultural marketing channels have taken place against a background of relative ignorance of how these markets work. Combining theory (with coverage of complex contractual arrangements like outgrower contracts), household surveys, and in-depth knowledge of local contexts, this masterful book provides the first systematic answer. In their characteristically careful approach, the authors use simulation analysis based on oligopoly theory to isolate and quantify the effect of policy shocks one by one and with synergies, yielding precise orders of magnitude where theory is usually silent. Written in a limpid style, this book is a must-read for academics and sophisticated policy analysts. It will be a reference for years to come." Olivier Cadot, Professor of International Economics and Director of the Institute of Applied Economics at the University of Lausanne "This is an innovative and important book. The authors explicitly model the institutions and industrial organization of global trade and commodity exchanges, which have major implications for the efficiency and surplus distribution among the participants in the chain. The combination of theory and empirical analysis across many developing countries is unique and yields important new insights." Jo Swinnen, Professor of Development Economics at K.U.Leuven, Director of LICOS-Centre for Institutions and Economic Performance at K.U.Leuven and Senior Research Fellow in the Centre for European Policy Studies (CEPS), Brussels*

This book provides a framework for understanding micro, small and medium sized enterprises (MSMEs) as important contributors to economic growth. By examining the economic and investment decisions behind these businesses, the author shows how managers of MSMEs can add value to the firm by applying managerial finance tools. Early chapters establish the basic tenets of new venture development and financing and explore the economic environment that business-owners inhabit, focusing on venture capital, microfinance intervention, and public sector interventions. Later chapters guide the reader through the process of financial planning and forecasting, and valuation, finishing with insights into how to harvest investments and make sound financial decisions. The book has interdisciplinary appeal and offers a timely consideration of MSMEs in developing economies. It will be valuable reading for all interested in the management and development of small businesses, the finance of entrepreneurship and policy affecting small and medium sized enterprises.

The past decade has seen a lively debate on the methodology of econometrics: econometricians can now estimate almost any model they choose to specify, but many have expressed doubts about the practical usefulness and scientific validity of such models. In this volume, prominent historians of econometrics work with methodologists and practicing econometricians to illuminate current controversies and explain the origins of the present situation.

Filling a gap in the literature and all set to become the standard in this field, this monograph begins with a look at computational viscoelastic fluid mechanics and studies of turbulent flows of dilute polymer solutions. It then goes on to discuss simulations of nanocomposites, polymerization kinetics, computational approaches for polymers and modeling polyelectrolytes. Further sections deal with tire optimization, irreversible phenomena in polymers, the hydrodynamics of artificial and bacterial flagella as well as modeling and simulation in liquid crystals. The result is invaluable reading for polymer and theoretical chemists, chemists in industry, materials scientists and plastics technologists.

Have you ever dreamed of a weight loss program where you can eat as much as you want of all those things that you crave and still lose excess body fat? This dream program is now yours. This is an ad libitum program where you lose fat because of what you eat and not because of what you limit. You will discover through personal experience that there is no need to reduce calories or limit food groups to eliminate excess body fat. You will also obtain targeted fat loss since more fat will be lost from the waistline than from other parts of the body. Even more important, you will learn to think, feel and act in a different way around food. No magical remedies are promised and no miracle pills are promoted. Only through a sensible program and disciplined attitude will you be able to permanently rid yourself of excess fat. The book is divided into four parts. The first part explains why traditional diets are useless for long term weight loss, and how they may even worsen the problem. The second part presents a general outline of proven ways to permanently lose excess fat. The third part introduces a program which will not only help you nourish your body and lose excess fat; it will also reshape you to express your maximum genetic potential. The last part answers frequent questions made by my patients in relationship to this program. The philosophy of this program is the following: It is not what you eat in excess but what you are lacking in your daily menu that ruins your perfect metabolic balance and favors accumulation of excess body fat.

This article analyzes the theory of equilibrium real exchange rates and defines misalignment as a deviation of the real exchange rate (RER) from its equilibrium. The role of macroeconomic policies is then analyzed under three alternative nominal exchange rate regimes: predetermined nominal exchange rates; floating nominal and dual or black market nominal exchange rates. This discussion points out how inconsistent macroeconomic policies often lead to real exchange rate misalignment. Corrective measures, including nominal devaluation and several alternative approaches, are then evaluated.

In this scholarly and timely presentation of the history of economic thought, you will see how new ideas, evidence, problems and values can be used to reconsider basic concepts and major contributions of the past. THE EVOLUTION OF ECONOMIC THOUGHT, 8e covers the history of economics, the philosophies that drive the economic world, the thinking, the ideas of the great economic thinkers and their logical connections to the world. En este libro se trata una amplia tipología de modelos econométricos avanzados, los que destacan los modelos dinámicos, los modelos de ecuaciones simultáneas, los modelos no lineales, los modelos multivariantes de series temporales, los modelos de datos de panel y la teoría de raíces unitarias y modelos cointegrados. En cuanto a los modelos dinámicos, destacan los modelos con retardos distribuidos, los modelos de regresores estocásticos, los modelos con cambio estructural y los modelos dinámicos con datos de panel. Se trata ampliamente la teoría de las raíces unitarias, la cointegración y los modelos de corrección del error. Los modelos econométricos multiecuacionales se caracterizan por la presencia de varias ecuaciones para estimarse simultáneamente. Se trata por tanto de una generalización de los modelos uniecuacionales al campo de los sistemas de ecuaciones. En este libro se tratan los modelos lineales multiecuacionales en ecuaciones simultáneas, incorporándose la teoría de la identificación de modelos y las técnicas avanzadas de estimación (MLE, MC2E, MC3E, RANR, SUR, etc.). A continuación se abordan los modelos multivariantes de series temporales (VAR, VARX, VARMA, BVAR, VEC, etc.) tratándose la teoría de la cointegración desde la óptica multiecuacional. Asimismo se tratan en profundidad los modelos econométricos con datos de panel, tanto estáticos como dinámicos, contemplando a su vez los modelos estáticos y dinámicos así como

teoría de las raíces unitarias y la cointegración en paneles. Finalmente, se se profundiza en los modelos uniecuacionales y multiecuacionales no lineales y los modelos de regresión particionada y segmentada. Todo el desarrollo de ejercicios prácticos se realiza utilizando el software EViews, uno de los más actual del momento adecuado para estas tareas econométricas no triviales.

Rampant inflation is a major economic problem in many of the less developed countries; two out of three attempts to stabilize these economies fail. Stabilization provides a valuable description and a critical analysis of the disinflation programs introduced in Argentina, Bolivia, Brazil, and Israel in 1985-86, and discusses the possibility of such a program in Mexico. It documents the initial steps in stabilization as well as the reasons for failure. As architects of the programs, several of the authors are in key positions to assess which aspects were critical in getting programs accepted and where to look for difficulties and failures. In Israel, inflation was halted without recession. The challenge to policy makers today is in shifting from stabilization to the revival of sustained growth. This experience is described by Michael Bruno and Sylvia Piterman, who examine the critical issue of exchange rates, and by Alex Cukierman, who uses modeling to analyze the interaction of money wages, prices, and activity under rational expectations that take the government objectives into account. Endemic inflation and a sudden increase in external debt burden Argentina's economy, raising the wider issues of high inflation economies stabilization that are discussed in the chapter by José Luis Machinea and that by Di Tella and Alfredo Canavese. Eduardo Modiano and Mario Simonsen take up issues of wages in Brazil, particularly the problem of finding an equitable way to deal with a wage freeze; Simonsen develops an ambitious game theoretic rationalization of inflation policy as a coordinating device for imperfectly competitive economies. Bolivia did not have hyperinflation (price increases of more than 50 percent each month) before stabilization. Juan Antonio Morales shows how stabilizing the exchange rate, in an economy where all pricing was already geared to the dollar, achieved stabilization without a wage price freeze. And Francisco Gil Diaz asks whether an incomes-policy based program could work to control ever increasing inflation in Mexico. Michael Bruno is Governor of the Bank of Israel; Guido Di Tella is a Fellow of St. Anthony's College, a Professor at the Di Tella Institute in Buenos Aires, and a Member of Parliament in Argentina. Stanley Fischer is Vice President of Development Economics and Chief Economist at the World Bank. Rudiger Dornbusch is Ford International Professor of Economics at MIT.
