Diagnostic and therapeutic technologies continue to evolve rapidly, and both individual practitioners and clinical teams face increasingly complex ethical decisions. Unfortunately, the current state of medical knowledge does

not provide the guidance to make the majority of clinical decisions on the basis of evidence. The present research infrastructure is inefficient and frequently produces unreliable results that cannot be replicated. Even randomized controlled trials (RCTs), the traditional gold standards of the research reliability

Furthermore, many pertinent but unresolved clinical and medical systems issues do not seem to have attracted the interest of the research

that could last for twenty years or more. The great economic boom times in American history have come because of fortuitous discoveries. Natural resources (coal first, then oil) fueled vast economic and industrial expansions, which in turn helped create and supply new markets. The last genuine economic game changer

was the technology boom of the 1990s, which gave the U.S. a global competitive advantage for a while based on electronics and silicon. One of the first writers and analysts in the U.S. to predict that the tech boom would lead to a period of sustained economic growth was Charles Morris. In defiance of the recessionary times (in

1990), he saw the coming boom. Now, in 2013, he sees the threshold of another. This time the gift is natural gas. The amount and distribution of gas in American shale is so vast that it has the potential to transform the manufacturing economy, creating jobs across the country, and requiring a new infrastructure that will

Because of fracking, jobs that once would have been outsourced abroad will return home, America can become a net exporter of energy, and cheap energy will provide the opportunity for innovation and competition.
