Pharmaceutical and clinical calculations are critical to the delivery of safe, effective, and competent patient care and professional practice. Pharmaceutical and Clinical Calculations, Second Edition addresses this crucial component, while emphasizing contemporary pharmacy practices. Presenting the information in a well-organized and easy-to-understand manner, the authors explain the principles of clinical calculations involving dose and dosing regimens in patients with impaired organ functions, aminoglycoside therapy, pediatric and geriatric dosing, and radiopharmaceuticals with appropriate examples. Each chapter beg
an introduction to the topic, followed by a comprehensive discussion. Key concepts are highlighted throughout the book for easy retrieval. The examples presented in the text reflect the practice environment in community, hospital, and nuclear pharmacy settings, and the clinical problems presented reflect a direct application of underlying theoretical principles and discussions. Pharmaceutical and Clinical Calculations, Second Edition is an essential tool for any practitioner who needs to reinforce their knowledge of the subject and is a valuable study guide for the Pharmacy Board examination.
The National Health Service spends £8 billion a year on prescription drugs in primary care in England. This has grown 60% in real terms over the last decade and the trend continues to be upward. This report examines how the money could be spent more efficiently, without compromising clinical outcomes. It looks principally at the scope for more cost-effective prescribing; supporting the GPs and PCTs in getting better value for money, and the wastage of drugs. For four groups of drugs (which account for 19% of the total drugs bill), it finds a wide disparity in prescribing behaviour. It estimates that if all PCTs attained the sta
of the best 25%, £200 million could be saved. The analysis shows that there are several mechanisms to improve value for money. They include: personalised communication with GPs from local experts, financial and practical incentives, and involving the whole primary and local care community in decisions about drug policy. Wastage of drugs is a problem but the level is not monitored and the uptake of initiatives to reduce the amount of waste is low. Assessing whether local prescribing volumes are consistent with clinical need is complex, but combining prescription data with local prevalence data can provide benchmark inf

Alcohol use disorder (AUD) is a major public health problem in the United States. The estimated 12-month and lifetime prevalence values for AUD are 13.9% and 29.1%, respectively, with approximately half of individuals with lifetime AUD having a severe disorder. AUD and its sequelae also account for significant excess mortality and cost the United States more than $200 billion annually. Despite its high prevalence and numerous negative consequences, AUD remains undertreated. In fact, fewer than 1 in 10 individuals in the United States with a 12-month diagnosis of AUD receive any treatment. Nevertheless, effective a
based interventions are available, and treatment is associated with reductions in the risk of relapse and AUD-associated mortality. The American Psychiatric Association Practice Guideline for the Pharmacological Treatment of Patients With Alcohol Use Disorder seeks to reduce these substantial psychosocial and public health consequences of AUD for millions of affected individuals. The guideline focuses specifically on evidence-based pharmacological treatments for AUD in outpatient settings and includes additional information on assessment and treatment planning, which are an integral part of using pharmacotherapy to
In addition to reviewing the available evidence on the use of AUD pharmacotherapy, the guideline offers clear, concise, and actionable recommendation statements, each of which is given a rating that reflects the level of confidence that potential benefits of an intervention outweigh potential harms. The guideline provides guidance on implementing these recommendations into clinical practice, with the goal of improving quality of care and treatment outcomes of AUD.

The first HMG-CoA reductase inhibitor (statin) lovastatin, has been on the market since 1987. In that time, five more drugs from this class, atorvastatin, pravastatin, fluvastatin, rosuvastatin, and simvastatin, have been approved by the FDA. Statins, among the top ten most commonly prescribed drugs in the US, are now recommended as first-time treatments by all major regulatory agencies in the US and elsewhere. As shown in numerous clinical trials, statins are extremely powerful and effective in reducing LDL cholesterol, accompanied by a significant reduction of cardiac events and strokes. As a class, they are well-tolerated by most patients and are easy to administer. However, the withdrawal of cerivastatin (Baycol) from the market in 2001 due to severe myopathy in some patients has led to increased concern among clinicians with respect to this and other side effects, such as liver and kidney disease. Some studies suggest this has led to increased reluctance among clinicians to initiate a statin drug regimen or to adjust dosage to increase therapeutic effect. While a small minority of patients do develop serious complications while on statin therapy, current clinical evidence strongly suggests that the benefits of timely statin administration significantly outweigh the risks. Oxford American Pocket Notes: Statin Prescribing Guide aims to provide clinicians with concise, easily accessible guidance on prescribing statins in various clinical settings. This volume features evidence-based discussion on the indications, pharmacokinetics, and safety profiles of the available statins and how these properties translate into selection of the appropriate treatment regimen for the individual patient. Useful tools, such as treatment algorithms, charts, tables, and illustrations greatly help enhance the value of this volume as a portable reference tool.

This handbook serves as a reference guide for everyday clinical decision-making and provides the organisational knowledge necessary for those nurses who work on the interface of the statutory and voluntary sectors in health, education and social care.

Pain is both a symptom and a disease. It manifests in multiple forms and its treatment is complex. Physical, social, economic, and emotional consequences of pain can impair an individual's overall health, well-being, productivity, and relationships in myriad ways. The impact of pain at a population level is vast and, while estimates differ, the Centers for Disease Control and Prevention reported that 50 million U.S. adults are living in pain. In terms of pain's global impact, estimates suggest the problem affects approximately 1 in 5 adults across the world, with nearly 1 in 10 adults newly diagnosed with chronic pain each year. In recent years, the issues surrounding the complexity of pain management have contributed to increased demand for alternative strategies for treating pain. One such strategy is to expand use of topical pain medicationsâ€"medications applied to intact skin. This nonoral route of administration for pain medication has the potential benefit, in theory, of local activity and fewer systemic side effects. Compounding is an age-old pharmaceutical practice of combining, mixing, or adjusting ingredients to create a tailored medication to meet the needs of a patient. The aim of compounding, historically, has been to provide patients with access to therapeutic alternatives that are safe and effective, especially for people with clinical needs that cannot otherwise be met by commercially available FDA-approved drugs.
Compounded Topical Pain Creams explores issues regarding the safety and effectiveness of the ingredients in these pain creams. This report analyzes the available scientific data relating to the ingredients used in compounded topical pain creams and offers recommendations regarding the treatment of patients.

These guidelines provide recommendations that outline the critical aspects of infection prevention and control. The recommendations were developed using the best available evidence and consensus methods by the Infection Control Steering Committee. They have been prioritised as key areas to prevent and control infection in a healthcare facility. It is recognised that the level of risk may differ according to the different types of facility and therefore some recommendations should be justified by risk assessment. When implementing these recommendations all healthcare facilities need to consider the risk of transmission of infection and implement according to their specific setting and circumstances.

The U.S. Food and Drug Administration (FDA) has approved dozens of hormone therapy products for men and women, including estrogen, progesterone, testosterone, and related compounds. These products have been reviewed for safety and efficacy and are indicated for treatment of symptoms resulting from hormonal changes associated with menopause or other endocrine-based disorders. In recent decades, an increasing number of health care providers and patients have turned to custom-formulated, or compounded, drug preparations as an alternative to FDA-approved drug products for hormone-related health concerns. These compounded hormone preparations are often marketed as "bioidentical" or "natural" and are commonly referred to as compounded bioidentical hormone therapy (cBHT). In light of the fast-growing popularity of cBHT preparations, the clinical utility of these compounded preparations is a substantial public health concern for various stakeholders, including medical practitioners, patients, health advocacy organizations, and federal and state public health agencies. This report examines the clinical utility and uses of cBHT drug preparations and reviews the available evidence that would support marketing claims of the safety and effectiveness of cBHT preparations. It also assesses whether the available evidence suggests that these preparations have clinical utility and safety profiles warranting their clinical use and identifies patient populations that might benefit from cBHT preparations in lieu of FDA-approved BHT.
