"This book focuses on students, a pragmatic approach to treatment, regard for multidisciplinary perspectives, and respect for the influence of families on clients. Chapter 1 identifies concerns that new therapists frequently have, such as building confidence in their clinical work. Chapters 2-6 follow the usual time sequence of therapy--from initial contact with clients, to comprehensive assessment, to treatment planning and intervention. Chapters 7-10 deal with specific clinical situations based on presenting problems and the nature of client families. We examine major issues and approaches for working with children and adolescents, older adults, couples, and families that are struggling with serious mental illness. Chapter 11 highlights some common obstacles all therapists encounter, and provides concrete ideas on how to get unstuck when treatment is not progressing. Chapter 12 focuses on an often overlooked part of therapy--termination. In Chapter 13, we conclude the book by looking at emerging issues within family therapy"--

Written with the whole child in mind, this book discusses disorders in connection with the different stages of development, providing both a meaningful framework to promote learning. The authors emphasize multi-factor explanations of disorders as well as developmental frameworks and developmental pathways--presenting disorders and sets of disorders in the order in which they typically appear in a child's life. They also focus on the child-in-context (calling attention to the multiple settings in which the child is embedded) and emphasize the importance of taking a broad view that considers the whole child and his or her patterns of interest, abilities, and strengths, rather than a narrow view of a disorder or developmental delay. As a result of this holistic approach, which reflects the most up-to-date understanding of child and adolescent psychopathology, readers learn to think about disorders in the same way that caring adults think about disorders they encounter every day--in terms of an individual child who is coping with distress and dysfunction. Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.

The new edition of this brief introductory text retains the hallmark features that have made its parent text unique, while offering a more manageable, student-friendly format. The book was written with three goals in mind: to make the study of psychology accessible and engaging to the beginning student in psychology, to provide students with a solid grounding in the knowledge base in psychology, and to help students succeed in the course. Nevid's comprehensive learning system—derived from research on memory, learning, and textbook pedagogy—is featured throughout. This learning model incorporates what the author calls the Four E's of Effective Learning—Engaging Student Interest, Encoding Information, Elaborating Meaning, and Evaluating Progress. ESSENTIALS OF PSYCHOLOGY: CONCEPTS AND APPLICATIONS, 4th Edition, provides a broad view of psychology as well as applications of the knowledge gained from contemporary research to the problems and challenges we face in today's world. Essentials of Psychology introduces contemporary psychological research and caters to the varied needs of students and instructors. The book is composed of 14 basic chapters, which provide comprehensive coverage of theories and research within each of the traditional areas of psychology. Psychologists, students, and teachers of psychology will find this textbook very invaluable.

The United States Social Security Administration (SSA) administers two disability programs: Social Security Disability Insurance (SSDI), for disabled individuals, and their dependent family members, who have worked and contributed to the Social Security trust funds, and Supplemental Security Income (SSI), which is a means-tested program based on income and financial assets for adults aged 65 years or older and disabled adults and children. Both programs require that claimants have a disability and meet specific medical criteria in order to qualify for benefits. SSA establishes the presence of a medically-determined impairment in individuals with mental disorders other than intellectual disability through the use of standard diagnostic criteria, which include symptoms and signs. These impairments are established largely on reports of signs and symptoms of impairment and functional limitation. Psychological Testing in the Service of Disability Determination considers the use of psychological tests in evaluating disability claims submitted to the SSA. This report critically reviews selected psychological tests, including symptom validity tests, that could contribute to SSA disability determinations. The report discusses the possible uses of such tests and their contribution to disability determinations. Psychological Testing in the Service of Disability Determination discusses testing norms, qualifications for administration of tests, administration of tests, and reporting results. The recommendations of this report will help SSA improve the consistency and accuracy of disability determination in certain cases.
