hospitalists at any stage of their career. Electrocardiography is the technique by which the electrical activities of the heart are studied. The spread of excitation through myocardium (the heart muscle) produces local electrical potential. This causes flow of small currents through the body which acts as a volume conductor. These small currents can be picked up from the surface of the body by using suitable electrodes and recorded in the form of electrocardiogram. This technique was discovered by Dutch

physiologist, Einthoven Willem who is considered the father of ECG.

Electrocardiograph is the instrument by which the electrical activities of the heart are recorded. Electrocardiogram is the record or the graphical registration of electrical activities of the heart, which occur prior to the onset of mechanical activities. It is the summed electrical activity of all the cardiac muscle fibers recorded from the surface of the body. The electrocardiogram is recorded in 12 leads. The ECG is useful in
