*Surgical site infections are caused by bacteria that get in through incisions made during surgery. They threaten the lives of millions of patients each year and contribute to the spread of antibiotic resistance. In low- and middle-income countries, 11% of patients who undergo surgery are infected in the process. In Africa, up to 20% of women who have a caesarean section contract a wound infection, compromising their own health and their ability to care for their babies. But surgical site infections are not just a problem for poor countries. In the United States, they contribute to patients spending more than 400 000 extra days in hospital at a cost of an additional US \$10 billion per year. No international evidence-based guidelines had previously been available before WHO launched its global guidelines on the prevention of surgical site infection on 3 November 2016, and there are inconsistencies in the interpretation of evidence and recommendations in existing national guidelines. These new WHO guidelines are valid for any country and suitable to local adaptations, and take account of the strength of available scientific evidence, the cost and resource implications, and patient values and preferences.*

Longstanding evidence of the links between the environment, development and human health has led to a recognition of the need for public health policy to address such issues in low, middle and high income countries. One of the great challenges for public health practitioners is to understand and try to modify the relationship between the environment and human health. This book examines the underlying concepts and history of environmental public health including the key factors: • Air pollution • Chemical contamination • Climate hazards • Environmental quality • Environmental justice

This book has been fully revised to discuss recent international environmental conventions and legislation in the fast-moving world of global environmental change. A wide range of environmental issues are covered, such as urbanization and the impact of transport on air pollution, housing and indoor air quality, and the impact of environmental change on high altitude environments.

Understanding Public Health is an innovative series published by Open University Press in collaboration with the London School of Hygiene & Tropical Medicine, where it is used as a learning resource for postgraduate programmes. It provides self-directed learning covering the major issues in public health affecting low, middle and high income countries.

The second edition presents the wide range of environmental issues that are relevant to public health with academic rigour, but loses none of the ease of use for self-directed learning with several new activities and feedback within each chapter." Dr. Sotiris Vardoulakis, Head of Environmental Change Department, Public Health England, UK "The broad scope of environmental health is clearly presented in this book. The 19th century view of this branch of public health still prevalent among public health practitioners is updated, with a change to a global perspective. Energy choices, climate change, ecosystem services, waste are now appropriately included as environmental factors affecting human health.

Through this lens traditional topics of air, water and soil can be re-interpreted. This overview provides a solid foundation for all public health practitioners intending to include environmental health as part of a renewed mainstream public health capable of engaging with the full range of environmental challenges to sustainable health and wellbeing in contemporary societies." Dr. Leonardi, Head of the Environmental Epidemiology Group, Public Health England, UK

This Special Issue on the Systematics and Phylogeny of Weevils presents 31 new research papers on one of the most diverse and successful groups of animals on Earth, the beetle superfamily Curculionoidea. It was in part inspired to commemorate the extraordinary life and scientific achievements of Guillermo ("Willy") Kuschel (1918–2017), who shaped this field of science over the last century like no other weevil systematist. The papers in this memorial issue span weevil faunas from all over the globe, including South and Central America, Africa, Europe and the Near East, South-East Asia, New Guinea, Australia and New Zealand. They include major advances on the phylogeny and classification of the "broad-nosed" weevils (Entiminae), on the weevils associated with American cycads and on the unique extinct weevil fauna preserved in the 100-million-year-old Burmese amber, when weevils started to diversify alongside the oldest angiosperm plants. They comprise a tribute to Willy Kuschel, the proceedings of a weevil symposium held in his honor in 2016 in Orlando, Florida, 24 systematic studies (including seven phylogenetic analyses) and five other contributions on the diversity, biology, distribution, evolution and fossil history of weevils. In the papers collated in this volume, 30 new genera and 92 new species of weevils are described and a new family of extinct weevils is recognized.
