The current controversy over teaching evolution in the public schools has grabbed front-page headlines and topped news broadcasts all across the United States. In the Beginning investigates the movement that has ignited debate in state legislatures and at school board meetings. Reaching back to the origins of antievolutionism in the 1920s, and continuing to the promotion of intelligent design today, Michael Lienesch skillfully analyzes one of the most formidable political movements of the twentieth century. Applying extensive original sources and social movement theory, Lienesch begins with fundamentalism, describing how early twentieth-century fundamentalists worked to form a collective identity, to develop their own institutions, and to turn evolution from an idea into an issue. He traces the emerging antievolution movement through the 1920s, examining debates over Darwinism that took place on college campuses and in state legislatures throughout the country. With fresh insights and analysis, Lienesch retells the story of the 1925 Scopes "monkey" trial and reinterprets its meaning. In tracking the movement from that time to today, he explores the rise of creation science in the 1960s, the alliance with the New Christian Right in the 1980s, and the development of the theory of intelligent design in our own time. He concludes by speculating on its place in the politics of the twenty-first century. In the Beginning is essential for understanding the past, present, and future debates over the teaching of evolution.

This investigation examines how behind-the-scenes collaboration between governments, intelligence services and drug traffickers has lined the pockets of big business and Western banks. Beginning with a last-minute request from ex-governor Jesse Ventura, the narrative winds between the author's own story of covering "deep politics" and the facts he has uncovered. The ongoing campaign against Victor Bout, the "Merchant of Death," is revealed as "move/countermove" in a game of geopolitics, set against the background of a crumbling Soviet Union, a nascent Russia, bizarre assassinations, wars and smuggling.

Appendix to Second Report ...

With a polished walking stick and neatly pressed trousers, Richard Halliburton served as an intrepid globetrotting guide for millions of Americans in the 1920s and '30s. Readers waited with bated breath for each new article and book he wrote. During his career, Halliburton climbed the Matterhorn, nearly fell out of his plane while shooting the first aerial photographs of Mt. Everest, and became the first person to swim the Panama Canal. With his matinee idol looks, the Tennessee native was a media darling in an era of optimism and increased social openness. But as the Great Depression and looming war pushed America toward social conservatism, Halliburton more actively worked to hide his homosexuality, burnishing his image as a masculine trailblazer. As chronicled in American Daredevil, Halliburton harnessed the media of his day to gain and maintain a widespread following long before our age of the 24-hour news cycle, and thus became the first celebrity adventure journalist. And during the darkest hours of the Great Depression, Halliburton did something remarkable: he inspired generations of authors, journalists, and everyday people who dreamt of fame and glory to explore the world.

This third volume in the "Formation Testing" series further develops new methods and processes that are being developed in the oil and gas industry. In the 1990s through 2000s, the author co-developed Halliburton's commercially successful GeoTap™ real-time LWD/MWD method for formation testing, and also a parallel method used by China Oilfield Services, which enabled the use of data taken at early times, in low mobility and large flowline volume environments, to support the important estimation of mobility, compressibility and pore pressure, which are necessary for flow economics and fluid contact boundaries analyses (this work was later extended through two Department of Energy Small Business Innovation Research

awards). While extremely significant, the effect of high pressures in the borehole could not be fully accounted for – the formation tester measures a combination of reservoir and mud pressure and cannot ascertain how much is attributed to unimportant borehole effects. The usual approach is "simply wait" until the effects dissipate, which may require hours – which imply high drilling and logging costs, plus increased risks in safety and tool loss. The author has now modeled this "supercharge" effect and developed a powerful mathematical algorithm that fully accounts to mud interactions. In short, accurate predictions for mobility, compressibility and pore pressure can now be undertaken immediately after an interval is drilled without waiting. This groundbreaking new work is a must-have for any petroleum, reservoir, or mud engineer working in the industry, solving day-to-day problems that he or she encounters in the field.
