Excerpt from High School Chemistry, Consisting of Directions for Performing a Series of Experiments: With Test Questions on the Experiments, and Simple Problems for Investigation A knowledge of chemistry is acquired by - 1. By experiment; 2. By accurate observation of the phenomena revealed by experiment, and by systematically recording these observations as they occur; 3. By reasoning based upon our observations; 4. By investigation; that is, by originating new processes or employing those with which the student is already familiar, and applying them to the solution of new problems; 5. By a knowledge of chemical theory, which is itself based upon a knowledge of the facts of chemistry, and becomes in its turn an aid in making further progress in the science. All these means of acquiring a knowledge of chemistry have been steadily kept in view in the preparation of this manual. I have long held the opinion that a textbook for beginners in chemistry should consist mainly of directions for performing a series of experiments. These experiments should be so graded and arranged that all the prominent facts and principles of the science could be re-discovered, as it were, by any intelligent pupil who performed the experiments and reasoned upon the phenomena they presented.
