*Green buildings have become common in India and other countries in Asia. However, there is a concern regarding the performance of green buildings failing to meet the expectations of clients during the operation. One of the key reasons for this is poorly commissioned HVAC systems. In this publication we provide tools and knowhow for more efficient HVAC commissioning. It gives answers for four major questions: why commissioning is needed, how to perform proper commissioning, which key performance issues of common HVAC equipment need to be considered, and what kind of checklists are used during commissioning? It covers the entire commissioning process beginning with the owner's project requirements and commissioning design reviews. Then, it explains procedures during installation and start-up of equipment followed by the functional performance testing, seasonal commissioning and 10 months' operation review. This publication is developed by Indian Society of Heating, Refrigeration and Air Conditioning Engineers ISHRAE for Indian and Asian requirements in conjunction with the Federation of European HVAC Associations REHVA. The process steps described in this publication are in line with all major international building standards and green building certification schemes. Note: T&F does not sell or distribute the Hardback in India, Pakistan, Nepal, Bhutan, Bangladesh and Sri Lanka.*

When Jesse Kuhlman started this guide, his original intention was for it to be used by his own employees of Kuhlman Electrical Services, Inc. to refer to and learn from. Jesse takes the education of his company's employees very seriously and hoped to make them better field electricians. Being an effective troubleshooter, is one of the more difficult things to teach an employee as it requires a lot of experience due to the many different issues one may come across. As he started to develop the guide, Jesse thought why not tweak it, so it could be used by anyone who is interested? The potential audience includes everyone ranging from homeowners who are interested in electrical problems, to field electricians looking to improve their skills.This guide covers troubleshooting situations that can be found in residential homes including:\* Switches\* GFCI's\* Arc-Fault circuit breakers\* Electric Heat\* Electrical Panels\* Lighting\* Basic HVAC systems\* Low voltage doorbell, cable, Cat6 wiring\* Troubleshooting steps depending on situation\* And much more!!Jesse Kuhlman always said he learned the best from looking at diagrams, and put many in this guide. They can be found throughout and should help the reader in further understanding the material.At the end of writing this guide, Jesse said if this guide helps even one person to be a better electrician, mission accomplished!

Depending on what part of the country that you reside in, gas-burning heating systems can be either an absolute necessity or a rarity. For those that maintain, service and instal gas heating systems or those just looking for a more in-depth source of accurate information, this modular training program focuses on furnaces and boilers that burn natural gas or LP. The combustion of gas to generate heat can be dangerous and should be thoroughly understood by HVAC technicians. This program covers many facets of gas heating including: combustion, system components and controls, heating sequences, installation, and troubleshooting. Through advancements in technology, modern heating systems have become far more efficient than their predecessors. Integrated circuit boards and electronic ignition systems have replaced the mechanical controls and manually lit pilots of older systems. Today, technicians may encounter furnaces or boilers that are older than they are, complex high-efficient systems, or anything in between. It is critical that they have a working knowledge of all these systems. This manual provides students and practicing technicians with the information and knowledge necessary to safely work on systems that incorporate gas combustion to provide heat. The information to service, maintain, and install these systems is also presented in an easy-to-understand format. The manual is full of color images and diagrams and includes end-of-chapter worksheets. Gas Heating was written to be a primary text that focuses specifically on gas-burning heating systems which can be used as a stand-alone text or a supplement to your current text book.

By the time I decided to start writing this book, I had worked in the HVAC & R industry for more than forty-five years. In this span of time, I had worked as a service technician in an NYC service company and as a trade instructor in several schools (see profile). I had written books and works; among them are RAC & E test-books, preparation for the EPAs certification, and the RMO's License for the NYC Fire Department, which had been used in the schools in which I worked. Regardless of the years that had passed, the refrigeration system used in Air Conditioning, systems as well as in Commercial Refrigeration, Domestic Refrigeration, etc., and in the equipment in general used today contains the same mechanical-electrical components as then.
