GEORGE CHRISTOU Indiana University, Bloomington I am no doubt representative of a large number of current inorganic chemists in having obtained my undergraduate and postgraduate degrees in the 1970s. It was during this period that I began my continuing love affair with this subject, and the fact that it happened while I was a student in an organic laboratory is beside the point. I was always enchanted by the more physical aspects of inorganic chemistry; while being captivated from an early stage by the synthetic side, and the measure of creation with a small c that it entails, I nevertheless found the application of various theoretical, spectroscopic and physicochemical techniques to inorganic compounds to be fascinating, stimulating, educational and downright exciting. The various bonding theories, for example, and their use to explain or interpret spectroscopic observations were more or less universally accepted as belonging within the realm of inorganic chemistry, and textbooks of the day had whole sections on bonding theories, magnetism, kinetics, electron-transfer mechanisms and so on. However, things changed, and subsequent inorganic chemistry teaching texts tended to emphasize the more synthetic and descriptive side of the field. There are a number of reasons for this, and they no doubt include the rise of diamagnetic organometallic chemistry as the dominant subdiscipline within inorganic chemistry and its relative narrowness vis-d-vis physical

We feel pleasure to introduce the first edition of this text-book, covering the subject to the Pharmaceutical Inorganic Chemistry-I prescribed in the first year of bachelor of Pharmacy as per Education Regulation, 2020. The matter has been divided into 8 chapters. Each chapter has been written in some detail in order to prepare the students for the better understanding of the subject of Pharmaceutical Inorganic Chemistry as it is places in the beginning of the course and the newly admitted students may find difficult to understand. This book is in very easily understandable English where students do not find it difficult to understand. This books also helps in clear basic concepts of pharmaceutical inorganic chemistry where students are able to connect the subject with its application in daily life. For preparing the subject, we have consulted the number of books and Indian Pharmacopoeia. I am thankful to the author of them.

**Starting in the 1850s achievement tests became standardized in the British Isles, and were administered on an industrial scale. By the end of the century more than two million people had written mass exams, particularly in science, technology, and mathematics. Some candidates responded to this standardization by cramming or cheating; others embraced the hope that such tests rewarded not only knowledge but also merit. Written with humour, Making a Grade looks at how standardized testing practices quietly appeared, and then spread worldwide. This book situates mass exams, marks, and credentials in an emerging paper-based meritocracy, arguing that such exams often first appeared as "cameras" to neutrally record achievement, and then became "engines" to change education as people tailored their behaviour to fit these tests. Taking the perspectives of both examiners and examinees, Making a Grade claims that our own culture's desire for accountability through objective testing has a long history.**
