Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

The Sixth Edition of INTRODUCTORY CHEMISTRY: A FOUNDATION, INTERNATIONAL EDITION offers unparalleled teaching and learning resources, with a robust technology package, in addition to the superior problem-solving pedagogy, engaging writing style, and strong emphasis on everyday applications that comprise the hallmarks of this best-selling text. The use of natural catalysts - enzymes - for the transformation of non-natural is not at all new: they have been used for more man-made compounds than one hundred years, employed either as whole cells, cell organelles or isolated enzymes [1]. Certainly, the object of most

research was totally different from that of the present day. Thus the elucidation of biochemical pathways and enzyme mechanisms was the reasearch some decades ago. It was mainly during the 1980s that the enormous potential of applying natural catalysts to transform compounds was recognized. What started as a trend in the late 1970s could almost be called a fashion in synthetic organic chemistry in Although the early euphoria during the 'gold rush' in this field seems to have eased somewhat, there is still no limit to be seen for the fr such methods. As a result of this extensive, recent research, there have been an estimated 5000 papers published on the subject [2].
