Measurement refers generally to the process of assigning a numeric value to, or ordering characteristics or traits of, entities. Measurement is necessary for building and testing theory, specifying problems, and defining goals. It is arguably one of the most and difficult tasks in social work research. Social work researchers who are not expert in developing, selecting, and using measures will not be able to contribute maximally to the social work knowledge base. Such knowledge and skills related to measurement ultimately determine the extent to which social work research can effectively inform social policy and social work interventions. This book is to serve as a guide for developing, selecting, and using measures in social work research. In particular, this book provides a detailed review of construct validity theory; an update on the major issues of reliability; common errors in measurement of latent variables; and suggestions for the measurement of social networks and collectives. An important theme of this book is the focus on the creative potential of measurement, that is, helping social work researchers think about the wide variety of ways that social work concepts can be measured. Real-world differences raises questions about underlying assumptions that in turn inspires creative theoretical insights. Rather than see measurement as simply a task to be completed in the research process, we will encourage the reader to think creatively about measurement and theory. This book also addresses the interdependency of measurement and theory construction. In other words, this book shows that measurement and theory are connected in two different ways. First, every measure has its own working theory that relates the concept being measured. Second, theory construction is dependent on measurement. What we learn using a given measure is different if a concept was measured in a different way.

First released in the Spring of 1999, How People Learn has been expanded to show how the theories and insights from the original book can translate into actions and practice, now

making a real connection between classroom activities and learning behavior. This edition includes far-reaching suggestions for research that could increase the impact that classroom teaching has on actual learning. Like the original edition, this book offers exciting new research about the mind and the brain that provides answers to a number of compelling questions. When do infants begin to learn? How do experts learn and how is this different from non-experts? What can teachers and schools do-with curricula, classroom settings, and teaching methods--to help children learn most effectively? New evidence from many branches of science has significantly added to our understanding of what it means to know, from the neural processes that occur during learning to the influence of culture on what people see and absorb. How People Learn examines these findings and their implications for what we teach, how we teach it, and how we assess what our children learn. The book uses exemplary teaching to illustrate how approaches based on what we now know result in in-depth learning. This new knowledge calls into question concepts and practices firmly entrenched in our current education system. Topics include: How learning actually changes the physical structure of the brain. How existing knowledge affects what people notice and how they learn. What the thought processes of experts tell us about how to teach. The amazing learning potential of infants. The relationship of classroom learning and everyday settings of community and workplace. Learning needs and opportunities for teachers. A realistic look at the role of technology in education.
