Further information about the book can be found at okomedien.de/buecher/informatik---computer-science/laz Targeted groups: Students of computer science, mathematics, engineering and natural sciences, both beginners and those who are changing to other programming languages or development environments, who would like to get to know the possibilities of the free development environment Lazarus more intensively or are planning to switch to this development tool.

A compiler translates a program written in a high level language into a program written in a lower level language. For students of computer science, building a compiler from scratch is a rite of passage: a challenging and fun project that offers insight into many different aspects of computer science, some deeply theoretical, and others highly practical. This book offers a one semester introduction into compiler construction, enabling the reader to build a simple compiler that accepts a C-like language and translates it into working X86 or ARM assembly language. It is most suitable for undergraduate students who have some experience programming in C, and have taken courses in data structures and computer architecture.

Featuring a wealth of code examples appropriate for practicing developers, this advanced-level guide provides comprehensive coverage of such topics as arrays, binary trees, data compression. The CD includes the author's highly successful freeware library, EZDSL, along with the code from the book.

A preliminary version of the programming language Pascal was drafted in 1968. It followed in its spirit the Algol-60 and Algol-W line of languages. After an extensive development phase, a first compiler became operational in 1970, and publication followed a year later (see References 1 and 8, p.14). The growing interest in the development of compilers for other computers called for a consolidation of Pascal, and two years of experience in the use of the language dictated a few revisions. This led in 1973 to the publication of a Revised Report and a definition of a language representation in terms of the ISO character set. This booklet consists of two parts: The User Manual, and the Revised Report. The Manual is directed to those who have previously acquired some familiarity with computer programming, and who wish to get acquainted with the language Pascal. Hence, the style of the Manual is that of a tutorial, and many examples are included to demonstrate the various features of Pascal. Summarising tables and syntax specifications are added as Appendices. The Report is included in this booklet to serve as a concise, ultimate reference for both programmers and implementors. It defines standard Pascal which constitutes a common base between various implementations of the language.

Pascal is the standard structured programming language for the personal computer. The novice programmer needs a strong grounding in the fundamentals of structured programming, whether preparing to program under Microsoft Windows, DOS, or the Apple Macintosh. Pascal is also a precursor to programming languages such as C++, Java, and Delphi. "Learn Pascal" teaches the novice programmer the basics of Pascal through hands-on examples and easy-to-follow drills in each chapter, and guides readers from the basic fundamentals to advanced techniques needed to effectively program real-world applications. The book also includes advanced material on problem-solving algorithms, which provide the experienced Pascal user with specialized tools to solve specific programming problems. The companion CD contains the examples and drills discussed in the book, along with the drill solutions. Also included is a full retail version of Delphi 4 Standard Edition. Sam Abolrous is a software engineer with an extensive background in software design and programming. He earned his electrical engineering degree from the University of Alexandria, Egypt, and is currently a programmer/writer with Microsoft Corp. Abolrous has published articles for leading programming journals and has written over 50 books on computer science ranging from C++ to COBOL programming, including Wordware's "Learn C in Three Days" and "Learn Pascal in Three Days, Second Edition".

Meandering Melodies will take you back to the 60's, 70's, and 80's and share what it was like to be a part of a neighborhood in Carroll County located in Delphi, Indiana, that had lots of children, a simple way of life, what we did for fun and what it was like to be part of a "Plain People" growing up among other "Plain People." Meandering Melodies will also share what life is like among the "Plain People" today in 2013 in Carroll County. Expect to be delighted, thrilled, and encouraged as we not only take a walk down memory lane together but also explore living life "out of the fast lane" in today's world. Experiences that will at times make you laugh and cry as we learn together how simple joys of yesterday and simple joys of today can create a symphony that lasts a lifetime! Most of us can remember a time when life was not so busy. A simpler time when we enjoyed a visit with a neighbor or a walk in the park. . . A time when we had no concern about being a certain place at a certain time doing certain things... A time when fast food was not really all that fast and the computer age had barely begun. . . A time when life was busy but did not seem hectic or fast-paced. . . Sometimes we even look back with nostalgic longing and wish to return to times like this. Times when we'd like to get "out of the fast lane.." Today finds many people living life in the fast lane where life is in constant motion and meticulous plans are made to ensure their success in the modern world. There is always some place to go and people to meet. Yet they are intrigued by certain lifestyles and fascinated by those who seem to manage living a simple life "out of the fast lane." In the past few years many books have been written and movies made showcasing the Amish, Mennonites, and other Plain People and their simple lifestyles. People wonder about the differences. People wonder what their

lifestyle is really like. People wonder what it is like to be a part of a plain church and plain people. They have all sorts of questions about what it is like not to have cars, or telephones, or electricity. They wonder why they dress the way they do and do the things they do. They wonder how people can live like this?!! It seems to them that life is lived "out of the fast lane" among Plain People. Or is this only an illusion? I grew up among Plain People on a farm in Carroll County nestled between two hills. Bachelor Run flowed merrily through our farm forming the southern boundary of our property. Folks called the road at the top of the south hill the Crooked Road. It went straight for several miles out of Delphi, then made a sharp curve, and after several more curves, you ended up in Flora. Our house was in the valley below this first curve. This first curve was a notorious place for wrecks; which I shall write more about later! My Dad built our house against the bank of the north hill. At the very top of the north hill was a very old cemetery called the Nettle Cemetery. I don't recall anyone ever being buried there. I also don't recall ever playing there. I do remember mowing the grass along the fence that separated our property. One of my favorite spots, my very own idyllic hide-a-way, was close to this fence. I went there often to think and write and lay in the grass on beautiful summer days. Most of our neighbors were members of what we called the Horse-and-Buggy Church. Their official name was Old Brethren German Baptist. They used to be a part of our fellowship before they split off from the Old German Baptist Brethren in 1921 as a result of differences about cars, electricity, and telephones. When was the last time you experienced life "out of the fast lane?"

Memory management. One of the most basic parts of software development, often kept on the side even though it has the most profound effect on how we write our code. Delphi provides a variety of types with their own memory management logic, as well as two sets of compilers that provide different memory management systems for classes. * Classic Delphi compiler currently supported on Windows and OSX platforms - using manual memory management while providing ARC for certain types. * Next generation ARC Delphi compiler supported on mobile Android and iOS platforms, as well as Linux - using full ARC - Automatic Reference

Counting memory management system. Each memory management system has its good and bad sides. Each offers solutions to some problems, but creates a whole range of other problems. And each requires slightly different coding patterns and practices. Knowing the strengths and weaknesses and understanding how memory management system(s) work goes hand-in-hand with writing clean, bug-free and maintainable code. Both compilers are covered in detail, as well as coding patterns required for writing cross-compiler code that must run under both. From manual memory management, to garbage collection, different memory management systems differ not only by the general category they fall in, but also by implementation. And all those fine implementation details also have a great impact on actual code. From the perspective of the everyday software development process discussing memory management is impossible without discussing its specific implementation in specific languages and toolsets.
