Appealing to reason rather than religious belief, this book is the most comprehensive case against the choice of abortion yet published. The Ethics of Abortion critically evaluates all the major grounds for denying fetal personhood, including the views of those who defend not only abortion but also infanticide. It also provides several (non-theological) justifications for the conclusion that all human beings, including those in utero, should be respected as persons. This book also critiques the view that abortion is not wrong even if the human fetus is a person. The Ethics of Abortion examines hard cases for those who are prolife, such as abortion in cases of rape or in order to save the mother’s life, as well as hard cases for defenders of abortion, such as sex selection abortion and the rationale for being “personally opposed” but publically supportive of abortion. It concludes with a discussion of whether artificial wombs might end the abortion debate. Answering the arguments of defenders of abortion, this book provides reasoned justification for the view that all intentional abortions are morally wrong and that doctors and nurses who object to abortion should not be forced to act against their consciences.

It's obvious why only men develop prostate cancer and why only women get ovarian cancer. But it is not obvious why women are more likely to recover language ability after a stroke than men or why women are more apt to develop autoimmune diseases such as lupus. Sex differences in health throughout the lifespan have been documented. Exploring the Biological Contributions to Human Health begins to snap the pieces of the puzzle into place so that this knowledge can be used to improve health for both sexes. From behavior and cognition to metabolism and response to chemicals and infectious organisms, this book explores the health impact of sex (being male or female, according to reproductive organs and chromosomes) and gender (one's sense of self as male or female in society). Exploring the Biological Contributions to Human Health discusses basic biochemical differences in the cells of males and females and health variability between the sexes from conception throughout life. The book identifies key research needs and opportunities and addresses barriers to research. Exploring the Biological Contributions to Human Health will be important to health policy makers, basic, applied, and clinical researchers, educators, providers, and journalists-while being very accessible to interested lay readers.

Tears of a barren womb is a heartfelt, real-life account and well-researched useful tool that is more than just a book. The author, Essie, details her personal struggles and challenges of infertility in a sole bid to encourage couples and individuals that are battling infertility and speak largely to humanity and bring to the surface the rather stigmatized and taboo subject of infertility.

From the moment of fertilization until the day of birth, the extraordinary life of a fetus is chronicled in this awe-inspiring volume drawn from the latest in pre-natal research. "How Life Begins, taking advantage of the relatively recent advent of ultrasound technology and other imaging techniques, offers a month-by-month guide to what a developing baby is seeing, hearing, dreaming about, and how it is accomplishing the miracle of preparing to be human. Readers will discover: How a fetus's eye movements work to "boot up" the computer that is its brain How the hands and feet commit programmed suicide to create fingers and What role genetics plays in determining an infant's sexual identity and personality How the baby becomes the choreographer of the mother's labor, and the director of his or her own birth Interviews with leading researchers combine with truly remarkable photography to make "How Life Begins an unforgettable journey marking the passage from single cell to bright-eyed baby.

ABC - Life in the Womb is a fun and exciting alphabet book for kids to learn how babies grow and develop in their mother's womb. For example: The baby starts off the size of a grain of salt. As early as 16 weeks baby will practice breathing by inhaling amniotic fluid into tiny developing lungs. This book is especially fun for big brother or sister, to follow along on baby's journey as they await baby's grand entrance. About the creators: Valerie Silva and Hillary Craig met in 2014 while at a volunteer training for their local PMC, (Pregnancy Medical Center) in Hollister, California. Their hope for this book is to see children and adults alike grow and share their knowledge about the precious life of a baby in the womb. They want future generations to value life and stand up for those who cannot speak for themselves. "For You created my inmost being; You knit me together in my mother's womb." Psalm 139:13 NIV

During the past several decades, the fetus has been diversely represented in political debates, medical textbooks and journals, personal memoirs and autobiographies, museum exhibits and mass media, and civil and criminal law. Ourselves Unborn argues that the meanings people attribute to the fetus are not based simply on biological fact or theological truth, but are in fact strongly influenced by competing definitions of personhood and identity, beliefs about knowledge and authority, and assumptions about gender roles and sexuality. In addition, these meanings can be shaped by dramatic historical change: over the course of the twentieth century, medical and technological changes made fetal development more comprehensible, while political and social changes made the fetus a subject of public controversy. Moreover, since the late nineteenth century, questions about how fetal life develops and should be valued have frequently intersected with debates about the authority of science and religion, and the relationship between the individual and society. In examining the contested history of fetal meanings, Sara Dubow brings a fresh perspective to these vital debates.

Paul presents an in-depth examination of how personalities are formed by biological, social, and emotional factors.

Rapid advances in biotechnology offer new capabilities in human reproduction. These bring with them dilemmas regarding the possibilities of their use. Editors Roman Miller and Beryl Brubaker look at the ethics of this decision-making from a broad range of perspectives. Simple answers are not provided. However, some guidelines are suggested to help Christians respond as a community.

HAS YOUR WOMB FULFILLED ITS MANDATE? This book underscores the relevance, significance, and untapped power of the womb. It is important to note that the lifestyle of a child is determined right from the womb and their future is shaped from there. ★ But how can the lifestyle of the unborn really be determined from the womb? ★ How does the womb act as an altar for the bringing of a new life into the world? ★ How does the pregnant woman bond with the foetus in her womb? These are a few questions that this book answers in clear and helpful ways. This book also shows that beyond overcoming the problems of barrenness and freely giving birth to children, God had a mandate for the womb, right from the beginning. ✓ What is that mandate? ✓ What should a woman do to fulfill God's original mandate for her womb? This book will reshape your thinking on the awesome power of your womb, and re-align your life, marriage, and future with God's original purpose.

God placed many parallels to the spiritual realm in the physical universe so the human brain could get some idea of the world that exists beyond the capacity of the human brain. One such parallel is the development of a baby in a mothers womb. Just as God took particles of the earth and made a body for the spirit he created, a woman takes the particles of her body and makes a body for a spirit that will live in that body. That body is developed inher womb and, at birth, that body becomes a womb for a human spirit. The author calls this newborn body The Womb of Time because it is the place where a human spirit is developed in time in preparation for an existence in a new world called Eternity. An embryo in a mothers womb is surrounded by chemicals that can prevent it from developing to a point capable of living in the world outside its womb. In the same way, a human spirit, in the womb of its body, is surrounded by knowledge, the curse from Eden that can prevent it from developing to a point capable of being a spirit with lifewhen it enters eternity. If a physical body is stillborn, no matter how much it is loved it cannot exist with people who are alive. A human spirit that is not alive when its body dies cannot exist with the living who reside in Heaven. God is constantly trying to nourish people in their Womb of Time with the same Word of Life he used to create all things. The human brain, limited to the knowledge it contains, often substitutes confidence for faith and religion for God causing many human spirits to be stillborn when they leave their body. Man's battle is between knowledge and faith.A quick look at the world will reveal the incompetence of knowledge.

When does consciousness begin? When does life start? When do we start to dream, and why? When do we know our mother? Much earlier than we think, is the answer of Douglas Arone. Pulling together evidence from recent research from a wide range of disciplines like neurobiology, neuro-immunology, neuro-anatomy, neurochemistry and others he comes to an astonishing conclusion: we are womb tricks us through pain-killers and memory blocks into accepting our state. When this doesn't work it gives rise to problems later in life, like mental disorders of all kinds. It explains why we later act and think as we do, from our preference for particular toys to our propensity to war. To understand our life in the womb is to understand the origins of human behaviour. And to understand th

When does life begin? Nobody wants to answer this question. Our courts cannot decide. Our government cannot decide. Our educational institutions cannot decide. Even our pulpits are growing more and more silent on the value of life in the womb. But God answered this question a very long time ago. Have you ever heard His thoughts on the matter? Conversation #1: Women, designed by God to create life in the womb for nine months and then to bring forth that life. To feed that life with the milk that fills our breast during post pregnancy. But what happens when that season is over, and the birthing womb begins to shut down? Answer: Hot flashes, night sweats, personal summers, and mood swings. It's the season that almost every woman will go through. Yet, it's the elephant in the room no one wants to talk about. The elephant's name is menopause. The author shares her personal story of night sweats, hot flashes, and mood swings. She shares a humorous story of having one of her first hot flashes while speaking with her male supervisor. She discusses what she defines as the "craziness" of mood swings. What about "man"opause? Yes, she goes there. By the way, did you know that menopause is just one day? (Huh?) Conversation #2: Around The Table The author addresses her grandchildren being biracial and the negative connotation behind the "one drop rule". The author shares true stories of other women's struggles and journeys. She challenges readers to remember before you judge, criticize, or ridicule someone to remind yourselves that: "We don't know their story." The author shares how she took her first swimming lessons in August 2017, and the importance of "letting go of the wall" both literally and symbolically in life. Her Christmas story, in which her father shared how much he loved her without saying a word, will warm your heart. Come join the author in an around the table discussion as she addresses a few of her questions, comments, and concerns. This book is an informative read for both women and men. ***As a child grows and develops inside its mother's womb, parents constantly ask each other 'What's happening with the baby now?'* As a result of Alexander Tsiaras' s remarkable achievements in medical imaging technology, they can turn to the pages of this extraordinary book for an answer at any point during the pregnancy -from conception to birth.FROM CONCEPTION TO BIRTH is based on hvo revolutions in science. As biologists have decoded the molecular basis of life, computer scientists have developed three-dimensional techniques for scanning and displaying the body; which can isolate nervous, skeletal, circulatory systems and view them down to a molecular level. Alexander Tsiaras founded his medical imaging company Anatomical Travelogue on these discoveries, and his scanning techniques promise a completely new way for doctors to examine and diagnose their patients, and also make it possible to track the development of human beings from the moment of conception.If the science behind this book is fascinating, the images themselves are spectacular, showing the never-before-witnessed process of human creation in astonishingly beautiful detail, as we see the eye appear, the heart and lungs start to work, the hands grow and flex.**

How the Nine Months Before Birth Shape the Rest of Our Lives

Origins

The Seeds of Life

This book is an intriguing insight into our early beginnings and their influences on our character and personality in our life, and our relationship with family, work and the wider implications worldwide. Shirley Ward, in her long career as a pioneering pre and perinatal psychotherapist, sets out clearly the basic principles of pre- and perinatal psychotherapy illustrated richly with case studies. This is an extraordinary and much needed study of foetal consciousness and our sacred journey from conception to birth, to give hope in a rapidly changing world. Having at its foundation the early pioneering work of Dt Frank Lake, the British psychiatrist who believed that our life was influenced from conception and our birth. Tracing the history of birth memories it is well known that the retrieval of pre and perinatal memories from conception, the time in the womb and birth can help us understand how and why we behave as we do in the world. Many answers are found in this earliest period of human development. By understanding the state of our parents at our conception, how we were treated in the womb and the type of birth we experience will all contribute to our personality, character and health. This book is written not only for professional and psychotherapists to understand seemingly irrational behaviour in their clients, whether children, teenagers or adults. There is something for everyone to understand, giving clarity and a reason to questions that have had no answer, and problems that may have their origins in this early non-verbal period of their lives. Evidence is showing that memories are stored in our bodies which give that necessary insight that negative thoughts from these early periods may be understood by consciously knowing the physical, historical and emotional beginnings and their influences upon us. The creative, dynamic theories of rhythms and patterns, fractals, as emphasised by Dr Jean Houston are synthesised into the work and also the understanding of the chakras and energy healing of Rosalyn Bruyere. It is shown that understanding evolves as more and more ideas influence our deeper meaning of life and living in the future. More research into the mind and brain sciences will also contribute to this invaluable work. Believing that healing the negative parts of our early life may help us heal the state of the planet Shirley Ward sees clearly the responsibility humanity has in looking at these rhythms and patterns of our lives that we project onto our earthly home. The message resounding throughout the book is that we are at the tip of the iceberg, gradually melting it, and understanding the wider implications that life begins before birth and not when we suddenly emerge from the womb. It gives a clear message that we can take charge of understanding our early beginnings. This better understanding will give a finer quality of life by dissipating or preventing too many unnecessary in the newborn. If parents understood the patterns surrounding their children's birth and teachers knew of the types of birth and the behaviour related to them a great deal of stress and conflict could be avoided. Remembering our children's children and the future of our earthly home is an incentive to gently absorb the urgency of this work to achieve some idea of the world being a safer, more peaceful and less conflicting place to live.

This novel, "In Vitro" is set against a background of gritty reality snatched from today's headlines. Dr. Mario Lopez is a driven man searching for love and the answer to the riddle of life and the human soul. His quest begins in the barrio of his youth. It takes him on a fascinating journey to a seminary where he learns the shocking secrets about some of the priests teaching there. Then fate takes him into the medical profession where he daily witnesses firsthand today's medical, ethical and religious controversies regarding reproduction technology ranging from in vitro fertilizaton to genetic selection of the newborn to the possibility of developing an artificail womb. Authentic details of an autopsy and surgery put the reader in the physician's shoes. This is an intriguing novel with unexpected twists and turns and larger than life characters including the three women in Mario's life that you won't forget. Maria Alvarez, Belle Starr, and Natasha, each strikingly different, each a possible downfall for Mario. After the first page, the reader can't put this book down. This is considered by many the new "Catcher in the Rye".

Why cracking the code of human conception took centuries of wild theories, misogynist blunders, and ludicrous mistakes Throughout most of human history, babies were surprises. People knew the basics: men and women had sex, and sometimes babies followed. But beyond that the origins of life were a colossal mystery. The Seeds of Life is the remarkable and rollicking story of how a series of blundering geniuses and brilliant amateurs struggled for two centuries to discover where, exactly, babies come from. Taking a page from investigative thrillers, acclaimed science writer Edward Dolnick looks to these early scientists as if they were detectives hot on the trail of a bedeviling and urgent mystery. These strange searchers included an Italian surgeon using shark teeth to prove that female reproductive organs were not 'failed' male genitalia, and a Catholic priest who designed ingenious miniature pants to prove that frogs required semen to fertilize their eggs. A witty and rousing history of science, The Seeds of Life presents our greatest scientists struggling-against their perceptions, their religious beliefs, and their deep-seated prejudices-to uncover how and where we come from.
