How do companies in high labor cost countries manage to remain competitive? In western manufacturing, the more manual a process, the more severe the competitive handicap of high wages. Full automation would make labor costs irrelevant but remain impractical in most industries.

Most successful manufacturing processes in advanced economies are neither fully manual nor fully automatic -- they involve interactions

between small numbers of highly skilled people and machines that account for the bulk of the manufacturing costs and thereby remain

competitive. In Working with Machines: The Nuts and Bolts of Lean Operations With Jidoka, author Michel Baudin explains how performance

differences that can be observed from one factory to the next are due to the way people use the machines -- from the human interfaces of

individual machines to the linking of machines into cells, the management of monuments and common services, automation, maintenance, and

production control.

This book, first published in 1987, is about the classic free will problem, construed in terms of the implications of moral responsibility. The principal thesis is that the core issue is metaphysical: can scientific laws postulate objectively necessary connections between an action and its causal antecedents? The author concludes they cannot, and that, therefore, free will and determinism can be reconciled.
