The process of combustion and the losses of heat in the still far from perfect furnaces of marine boilers, as well as the extreme importance of the capability of the firemen have been thoroughly gone into under the light of recent experiments. Liquid fuels have been comprehensively treated of on account of their extending application to warships. The fifth division is practically identical with the former fourth division. It relates to the performance and economy of marine engines but upon a much more extended basis than before as befits the development of the multiple-expansion principle. Modern Marine Engineer's Manual

This manual, first published in 1943, has been indispensable to ships engineers for generations. The third edition, revised and updated by a team of marine engineers/professors, follows in the venerable style of its predecessors. Text relating to obsolete equipment has been eliminated, information on systems that are still current has been updated, and new material has been added to reflect innovations in equipment and operative practices. Extensive coverage on the newest medium-speed diesel engine has been added to the text. Environmental concerns have been recognized with a section on engine exhaust emissions and information about new refrigerants and the maintenance of refrigeration systems. New equipment for trash handling, sewage processing, bilge water discharge, and incineration are discussed with reference to international regulations. Ship

trial procedures and the new equipment used in trial data collection are presented in detail. Offers guidelines for the operation, maintenance, and repair of heating boilers. This title is useful as a guide for the Heating Boiler Exam and to increase your understanding of boiler principles.
