Boston's public transportation network, the MBTA, is a "hub-and-spokes" system: rail lines radiate out to the suburbs from a few central downtown stations, and traveling between the "spokes" often requires taking multiple buses or traveling all the way inbound in order to transfer. Particularly on the bus and Commuter Rail systems, off-peak service is limited. For those who live in the suburbs and commute to the city during rush hour, this setup works relatively well. However, many women that depend on public transit for their daily commutes face unique challenges. This report examines the experiences of women who use public transit for their daily commutes, and how they navigate these challenges. The report also provides recommendations for how the MBTA can improve its services for women. The report is based on a survey of 200 women in the Boston area. I examine some of the unique challenges women face when using public transit, and how the MBTA could change to accommodate the travel patterns of the women surveyed.

As the world’s most rapidly growing source of energy, wind power has vast potential for mitigating climate change and advancing global environmental sustainability. Yet, the challenges facing wind energy remain both complex and substantial. Two such challenges are: 1) wildlife impacts; and 2) perceived negative effects on tourism. This dissertation examines these challenges in a multi-paper format, and also investigates the role that climate change perceptions play in garnering public support for wind power. The first paper assesses optimal approaches for addressing wind power’s wildlife impacts. Comparative analysis reveals that avian mortality from turbines ranks far behind avian mortality from a number of other anthropogenic sources. Additionally, although bats have recently emerged as more vulnerable to wind turbines than birds, they are generally less federally protected. The Migratory Bird Treaty Act (MBTA) protects over 800 bird species, regardless of their threatened or endangered status. Moreover, it criminalizes the incidental take of birds without a permit and simultaneously grants no permits for such incidental take, thereby creating a legal conundrum for the wind industry. An examination of the legislative and case history of the MBTA, however, reveals that wind operators are not likely to be prosecuted for incidental take if they cooperate with the U.S. Fish & Wildlife Service (FWS) and take reasonable steps to reduce siting and operational impacts. Furthermore, this study’s analysis reveals modest wildlife impacts from wind power: in comparison with numerous other energy sources, scientific research, legal, and policy recommendations are provided to update the present legal and regulatory regime under the MBTA and to minimize avian and bat impacts. For instance, FWS should establish comprehensive federal guidelines for wind facility siting, permitting, and mitigation; and promulgate regulations under the MBTA for the issuance of incidental take permits at wind facilities. Equal protections for bats are also recommended. In examining the potential effect of offshore wind power on coastal tourism, the second paper reports the findings of a summer 2007 survey of over 1,000 out-of-state tourists at Delaware beaches. Randomly sampled beachgoers were shown photo-simulations of wind turbines at increasing distances from shore and asked how each simulation would affect visitation. With wind turbines located six miles offshore, approximately one-quarter would switch to a different beach. This stated avoidance, however, diminishes with increasing wind project distance from shore. Additionally, stated avoidance of a beach with turbines six miles offshore is exceeded by: avoidance of a beach with an equidistant, inland, fossil fuel power plant; attraction to a beach in order to see turbines six miles offshore; and the likelihood of paying for an offshore wind boat tour. Further, logistic regression modeling reveals that neither trip cost nor income significantly influences the likelihood of visiting a beach with offshore wind. These findings suggest that to limit beach avoidance, offshore wind developers could site wind facilities further from shore, particularly in areas with high recreational use. Moreover, with wind turbines six miles offshore serving more as an attraction than as a deterrent, offshore wind development may, in fact, bolster local tourism revenues. The third study examines public perceptions of climate change and the link between those perceptions and support for wind power, both in general and with respect to specific offshore sites. Analyzing data from five surveys, this research uncovers low climate awareness and concern levels overall. Respondents demonstrate a poor understanding of climate change impacts and of how to effectively address climate change. In accordance with the New Ecological Paradigm, still fewer are concerned about climate change. The issue ranks 6 th in Delaware and 8th in Cape Cod as a reason for local project support, behind such issues as energy independence, electricity rates, air quality, and fishing and boating. Although disproportionately high percentages in Delaware and Cape Cod support taking climate action now - regardless of significant economic costs - this support appears to stem from the desire for climate mitigation’s co-benefits, rather than from the desire to mitigate climate change itself. Furthermore, strong support for taking gradual or no climate action steps reveals evidence for an inaccurate conceptualization of greenhouse gas accumulation in the atmosphere and of long-term climate change impacts. Nevertheless, those aware of, and concerned about, climate change, exhibit significantly stronger support for wind power. Climate communicators should therefore: focus on correcting faulty cultural models of climate change, while continuing to provide accurate climate information to the public; and consider discussing the co-benefits of addressing climate change, in addition to the direct, climate mitigation benefits. Through this improved understanding, enhanced political will for addressing climate change through wind energy may be at hand.

The evidence continues to grow that the effective management of risk is the very kernel of successful project management. Its absence frequently leaves project sponsors lamenting missed objectives and shareholders coming to terms with an organisation’s poor bottom line performance. Dr Robert Chapman’s The Rules of Project Risk Management stands out from other risk management texts because it provides very practical guidance, supported by numerous mini case studies, many of which have attracted considerable publicity. The book brings to life both the benefits of project risk management when effectively applied and the ramifications when it is misunderstood or receives scant attention. The structure of the book is based on International Standard ISO 31000 seen through the lens of general systems theory - where projects are undertaken by organisations which have an external context and internal sub-systems. A project system is seen to be composed of seven key subject areas. Practical short ‘rules’ or implementation guidelines, written in an engaging style, are offered to support each of these subject areas and aid quick assimilation of key risk management messages. Each rule focuses on a specific aspect of effective risk management which warrants attention in its own right. Taken together the rules will provide those implementing projects with the building blocks to secure a project’s objectives. They have been drawn from a wealth of experience gained from applying risk management practices across multiple industries from Europe to Africa, the Middle East and Asia.
