Drawing on elements of progressive education, existential theory, feminist pedagogy, and values education, critical humanism combines the holistic-psychological concerns of humanistic education with the sociopolitical tenets of critical pedagogy. Nemiroff presents an empowering new theory of an educational system that motivates students and encourages them to become active members in a truly democratic society. She also reviews this century's educational theories and the way this new theory and practice developed in one of North America's most experimental postsecondary programs, The New School of Dawson College.

In this book: Donna Dickenson - Winner of the International Spinoza Lens Award Should we do what ever science lets us do?Bioethics: All That Matters, new developments in biotechnology like genetics, stem cell research and artificial reproduction arouse both our greatest hopes and our greatest fears. Many people invest the new biotechnology with all the aspirations and faith once accorded to religious salvation. But does everyone benefit equally from scientific progress? Commercialised modern biomedicine runs the risk of exploiting vulnerable groups, from Indian 'surrogate' mothers to professional guinea pigs in drug research. Professor Dickenson argues that although we've entered new scientific territory, there's no need to jettison our existing moral sense. By discussing a range of real-life cases, she equips readers to make up their own minds on these important and controversial questions. Good science and good ethics needn't be contradictory. This accessible and concise book will appeal to both students and general readers, giving a fascinating introduction to a wide range of perspectives on Bioethics. All That Matters books: All books in the All That Matters series are written by world experts in their subject field. **Kate stared at the rickety wooden bridge. There were boards loose on its narrow walkway. There was no railing to hold on to. She was afraid to cross this bridge even in daylight. But she had to cross it now. She had to get to the train station in time to stop the midnight express. When a heavy storm destroyed the bridge over Honey Creek, near Kate Shelley's home in Moingona, Iowa, fifteen-year-old Kate bravely rushed out into the storm, saving the lives of two men and preventing hundreds of other lives from being lost. This is the true story of a young girl's resourcefulness and courage in the face of great danger. Though mathematical ideas underpin the study of neural networks, the author presents the fundamentals without the full mathematical apparatus. All aspects of the field are tackled, including artificial neurons as models of their real counterparts; the geometry of network action in pattern space; gradient descent methods, including back-propagation; associative memory and Hopfield nets; and self-organization and feature maps. The traditionally difficult topic of adaptive resonance theory is clarified within a hierarchical description of its operation. The book also includes several real-world examples to provide a concrete focus. This should enhance its appeal to those involved in the design, construction and management of networks in commercial environments and who wish to improve their understanding of network simulator packages. As a comprehensive and highly accessible introduction to one of the most important topics in cognitive and computer science, this volume should interest a wide range of readers, both students and professionals, in cognitive science, psychology, computer science and electrical engineering.**
