The **POCKETBOOK OF CARDIOLOGY** is designed to provide the practical information required for managing cardiology in-patients and out-patients. This includes sections on dealing with common out-patient consultations, common interspecialty referrals, cardiological problems on the cardiac surgery unit, acute cardiological emergencies, and terminal care in cardiology. Also, as cardiology is a speciality with a high technical content, sections are included that provide the core information relating to the common technical subspecialties - echocardiography, cardiac catheterisation and catheter intervention, pacing and electrophysiology. Finally, a technical data section provides details of normal values for cardiac catheterisation, echocardiography and electrocardiography. A practical manual of clinical cardiology, fully updated with the latest treatments and approaches. Attractive top colour layout. Written for doctors entering cardiology as career registrars who require practically-based materials, but of value to nursing staff and GPs. This revised edition has been fully updated with particular reference to the latest advances in cardiac catheterisation, and new changes in the therapeutic treatment of arrhythmias, IHD and ACS. Topics consist of history and examination, investigation and initial management of common orthopaedic trauma and elective presentations. In addition, this full-colour, user-friendly reference guide offers readers a look at the day-to-day clinical practice of a speciality that will affect at least half of the global population at some point, covering further chapters on epidemiology, biomechanics, common procedures, future developments and education. ABC of Orthopaedics and Trauma is an excellent resource for all healthcare professionals caring for patients with musculoskeletal and orthopaedic related disorders. This will be a valuable reference to orthopaedic trainees, sports physicians, physiotherapists, nurses, occupational therapists, clinical researchers and student doctors.

This publication brings together information on all aspects of OPLL - epidemiology, etiology, diagnosis, and treatment. It contains contributions by Japanese researchers and surgeons, including members of the Ministry of Health and Welfare Investigation Committee, and by American surgeons with expertise in the field. Until now, little has been published on the subject in English. This collection of reports is amply augmented with illustrations.

McRae's Elective Orthopaedics and Clinical Examination is both an examination manual and a text on orthopaedic pathology. As with its sister title McRae's Orthopaedic Trauma and Emergency Fracture Management this book is a unique combination of text and instructive illustrations which in the tradition of the books by Ronald McRae delivers concise and accessible information. The book will appeal to a wide audience. Primarily it will be used for regular reference by trainees in orthopaedic surgery. Associated healthcare professionals with extended roles, such as physiotherapists and nurse practitioners will find it equally useful. It will also be of assistance to medical students who are encountering patients, with musculoskeletal illness, for the first time. Consultant Orthopaedic Surgeons will also find it of considerable interest when they need to refresh their knowledge. This book is organised into two parts: the first part covers the relevant applied clinical sciences. The second part adopts a regional approach; in each region the individual diseases are described, along with non-operative and operative management. There are special boxes highlighting important clinical examination pearls and surgical techniques.

A Manual of Orthopaedic Terminology

Churchill's Pocketbook of Differential Diagnosis E-Book

The theme of this work is the application of the engineering theory of frictional torque to total hip replacement. The author adhered tenaciously to this theory, involving the use of a small-diameter femoral head, throughout the epoch when the large-diameter, metal-to-metal design dominated the field. During that considerable period general satisfaction with the early results rendered criticisms of the large-diameter head unwelcome. There was a formidable array of counter criticism: the small head would pierce a film of synovial fluid; the small head would wear the socket too rapidly; the small head would always have a high risk of dislocation; detachment of the trochanter, to achieve precise orientation for the small head, was unacceptable. But all these objections have now been largely overcome.

Lubrication of high molecular weight polyethylene (HMWP) on metal is now accepted as being mainly by the boundary regime with thick fluid films playing no part. We now know that HMWP can indeed tolerate the very high stresses imposed by the small head and in tribological theory there may even be some advantage in high stress. Dislocation is now known not to be an automatic sequel to the small head.

Traditionally, each speciality involved in craniomaxillofacial trauma and orthognathic surgery had its own areas of interest and expertise. This introductory textbook is different in that it presents the combined and focused expertise and competence of the different specialities on the entire craniofacial skeleton. The principles described in this textbook represent the evolution of craniomaxillofacial buttress reconstruction over the last 60 years. In addition to standard procedures, techniques representing recent surgical advances and new developments are introduced as well. This textbook not only provides an overview on current concepts of craniomaxillofacial trauma care and orthognathic surgery, but also helps to understand the complexity of the craniofacial skeleton and its related soft tissues for an efficient and successful reconstruction of the face following trauma and congenital deformities.

Preceded by Pocketbook of Orthopaedics and Fractures / Ronald McRae, 2nd ed., 2006.

This book provides in-depth coverage of all aspects of pelvic ring fractures and their management. The opening chapters supply essential information on surgical anatomy, biomechanics, classification, clinical evaluation, radiological diagnostics, and emergency and acute management. The various operative techniques, including navigation techniques, that have been established and standardized over the past two decades are then presented in a step-by-step approach. Readers will find guidance on surgical indications, choice of approaches, reduction and fixation strategies, complication management, and optimization of long-term results. Specific treatment concepts are described for age-specific fractures, including pediatric and geriatric injuries, and secondary reconstructions. Pelvic ring fractures represent challenging injuries, especially when they present with concomitant hemodynamic instability. This book will help trauma and orthopaedic surgeons at all levels of experience to achieve the primary treatment aim of anatomic restoration of the bony pelvis to preserve biomechanical stability and avoid malunion with resulting clinical impairments.

Few if any medical fields share the complexity of injuries and the number of available treatments that exist in orthopaedic trauma. Deciding on the most efficacious treatment can often be difficult. In this digital age with a tsunami of medical information and conflicting data on numerous approaches, practitioners who treat orthopaedic trauma often find it problematic to make "evidence-based" choices. Decision Making in Orthopaedic Trauma is the largest compendium of orthopaedic trauma algorithms assembled to date. The decision trees cover a broad spectrum of cases - from simple isolated fractures - to severe, life-threatening conditions. The decisions on which action to perform in each situation are largely based on the personal experiences of the individual authors, all members of the University of California, San Francisco (UCSF) / Zuckeberg San Francisco General (ZSFG) Orthopaedic Trauma Institute. When the decisions are supported by published scientific literature, the relevant publications are cited. Visually appealing, easy-to-comprehend decision trees detail underlying pathologies, suspected diagnoses, required imaging studies, possible treatment approaches, rehabilitation, expected outcomes, and posturgical care. The format is more conducive to swiftly acquiring knowledge and making informed decisions than traditional texts and websites. Key Features Management of a wide range of emergencies including compartment syndrome, open fractures, peripheral nerve injuries, mangled extremities, and multiple trauma Perioperative care - from acute and chronic pain management - to venous thromboembolism prevention and the use of regional anesthesia Major sections organized by anatomic region cover upper extremity, lower extremity, pelvic, hip, and spine trauma Clinical pearls on the management of osteoporotic, neoplastic, and periprosthetic fractures and fracture complications Impacted anatomy, differential diagnoses, and possible approaches visualized through high-quality color illustrations and radiographs Consistent color scheme differentiates anatomy, imaging, and rehabilitation guidelines Appendices provide a quick reference on imaging, bracing, and rehabilitation recommendations This uniquely formatted, visually rich book will enable surgeons, physicians, and residents to understand and apply critical decisions to a wide range of fractures, dislocations, nerve injuries, and musculoskeletal complications.

Apley & Solomon's Concise System of Orthopaedics and Trauma is firmly established as the leading introductory textbook of orthopaedic practice and the principles of fracture and trauma management. Praised in previous editions for the systematic approach, balanced content and readable style, this fifth edition has been brought fully up to date under the direction of the new and distinguished authorial team, while remaining true to the teaching principles of Alan Apley and his successor Louis Solomon. Key features: Focused - on diseases and clinical signs with additional detail on anatomy where appropriate International - enhanced coverage of global orthopaedics' reflect the changing pattern of musculoskeletal disease and trauma around the world Relevant - provides helpful guidance on simple procedures without unnecessary operative detail Readable - increased emphasis on concise presentation and new text features including chapter summaries, management algorithms and case studies Current - updates reflect developments in molecular biology, genetics and imaging technology This fifth edition remains the first choice for medical students, trainee surgeons and other health professionals seeking a convenient introduction to this large and complex subject and is a natural precursor to the more detailed coverage offered by its larger parent, Apley & Solomon's System of Orthopaedics and Trauma.

Low Friction Arthroplasty of the Hip

Major trauma care in England

A quick-reference, introductory guide to the essential information which a practitioner needs to know and understand when working in oral and maxillofacial medicine. Practical and concise, this handbook is the definitive guide to all common complaints and presentations. Care for patients, who have suffered major trauma, for example following a road accident or a fall, has not significantly improved in the last 20 years despite numerous reports identifying poor practice, and services are not being delivered efficiently or effectively. Survival rates vary significantly, with a range from five unexpected survivors to eight unexpected deaths per 100 trauma patients, reflecting the variable quality of care. 450 to 600 lives could be saved each year in England if major trauma care was managed more effectively. For best outcomes care should be led by consultants experienced in major trauma; but major trauma is most likely to occur at night and at weekends, when consultants are not normally in the emergency department. Major trauma care is not coordinated and there are no formal arrangements for taking patients directly for specialist treatment or transferring them between hospitals. A significant number of patients that need a scan CT do not receive one. Not enough patients who need a critical care bed are given one. Access to rehabilitation services varies and patients are not always receiving the care that they need. The estimated annual lost economic output from deaths and serious injuries from major trauma is between £3.3 billion and £3.7 billion. Only 60 per cent of hospitals delivering major trauma care contribute to the Trauma Audit and Research Network (TARN). The performance of the 40 per cent of hospitals that do not submit data to TARN cannot be measured.

Introducing a state-of-the-art text which comprehensively discusses the assessment of the musculoskeletal system. With expert contributors, this resource covers each body region in a consistent organizational approach. Outstanding features include high-quality photographs of tests in individuals with selected abnormalities, algorithms for examinations in specific clinical situations, and tables summarizing the findings in common diagnoses. Illustrates examination techniques with over 900 brand-new, high-quality photographs. Describes each procedure being illustrated, in detail, to help readers recognise signs in the surface anatomy. Utilises multiple photographs to demonstrate movement in dynamic tests such as the pivot shift test in the knee. Defines everything from fundamental terms and basic tests through advanced and supplementary examination techniques. Covers each body region in manner that is both accurate and clear and easy to understand. Discusses the pathologic conditions associated with different abnormal physical findings. Summarises the most common diagnoses for each examination in an easy-to-read table.

Trauma patients present a unique challenge to anesthesiologists, since they require resource-intensive care, often complicated by pre-existing medical conditions. This fully revised new edition focuses on a broad spectrum of traumatic injuries and the procedures anesthesiologists perform to care for trauma patients perioperatively, surgically, and post-operatively. Special emphasis is given to assessment and treatment of co-existing disease, including surgical management of trauma patients with head, spine, orthopaedic, cardiac, and burn injuries. Topics such as training for trauma (including use of simulation) and hypothermia in trauma are also covered. Six brand new chapters address pre-hospital and ED trauma management, imaging in trauma, surgical issues in head trauma and in abdominal trauma, anesthesia for oral and maxillofacial trauma, and prevention of injuries. The text is enhanced with numerous tables and 300 illustrations showcasing techniques of airway management, shock resuscitation, echocardiography and use of ultrasound for the performance of regional anesthesia in trauma.
