Addiction is increasingly being recognized as a major global public health issue, and an ever-growing number of medical specialties, psychological and social science training programs, and professional associations are including addiction as part of their training and continuing education curricula. The first edition of this book presented an overview of the spectrum of addiction-related problems across different cultures around the globe. Sharing the experience and wisdom of more than 260 leading experts in the field, and promoted by the International Society of Addiction Medicine, it compared and contrasted clinical practices in the field of addiction medicine on the basis of neurobiological similarities as well as epidemiological and socio-cultural differences. Building on the success of this inaugural edition, and taking into account the formal and informal comments received as well as an assessment of current need, this textbook presents general updated information while retaining the most requested sections of the first edition as demonstrated by the number of chapter downloads. It also provides a basic text for those preparing for the ISAM annual certification exam. Written by some 220 international experts, it is a valuable reference resource for anyone interested in medicine, psychology, nursing, and social science.

This open access State-of-the-Art Survey presents the main recent scientific outcomes in the area of reversible computation, focusing on those that have emerged during COST Action IC1405 "Reversible Computation - Extending Horizons of Computing", a European research network that operated from May 2015 to April 2019. Reversible computation is a new paradigm that extends the traditional forwards-only mode of computation with the ability to execute in reverse, so that computation can run backwards as easily and naturally as forwards. It aims to deliver novel computing devices and software, and to enhance existing systems by equipping them with reversibility. There are many potential applications of reversible computation, including languages and software tools for reliable and recovery-oriented distributed systems and revolutionary reversible logic gates and circuits, but they can only be realized and have lasting effect if conceptual and firm theoretical foundations are established first.

Reflections of a Police Psychologist is an account of the experiences, thoughts, and observations of a seasoned police veteran. It is written for police officers and those who would like a glimpse into the world of policing from the perspective of a former police officer and current police psychologist. Dr. Digliani discusses the major challenges facing those first entering police work. He addresses police field training and identifies the ten police field training pitfalls. The PATROL program, developed to assist new officers, is outlined. It involves an orientation and phase meetings between new officers and the staff psychologist to support them throughout field training. Dr. Digliani discusses how stress management becomes life management within the concepts of life-by-design and life-by-default. Inside the parameters of life management, a list of Some Things to Remember functions as an instrument for transactional change. The issues related to traumatic stress and exposure are discussed. The insights presented originate out of years of treating officers exposed to traumatic events. The role of police peer support teams is examined. Models for a peer support team policy and operational guidelines are presented. There is also information relating to the confidentiality of peer support interactions, a topic of current controversy. Traumatic incident debriefings and their applications in policing are elucidated, along with phase and freeze-frame models of debriefing. Included is a discussion of the current efficacy research pertinent to traumatic incident debriefings. Police family issues and the Foundation Building Blocks of Functional Relationships are outlined. Various family patterns of interaction are identified, including information for families of traumatized officers. There is a discussion of coping with death and loss, a critical area for police officers. An exposition of mental illness and interacting with the mentally ill from a police perspective is presented. Toward the end of the book, the retirement transition is discussed. In retirement or separation from service, officers return to the civilian world. Some experience difficulty with this transition. Issues to consider before retirement are presented. The final chapter includes the general reflections and policing history of Dr. Digliani. These reflections include the insights that come only with years of policing experience in several police assignments, including that of staff psychologist. This is an excellent book for anyone interested in law enforcement, policing, and police psychology.

The church across North America has struggled to minister effectively with children, teens, and adults with common mental health conditions and their families. One reason for the lack of ministry is the absence of a widely accepted model for mental health outreach and inclusion. In Mental Health and the Church: A Ministry Handbook for Including Children and Adults with ADHD, Anxiety, Mood Disorders, and Other Common Mental Health Conditions, Dr. Stephen Grcevich presents a simple and flexible model for mental health inclusion ministry for implementation by churches of all sizes, denominations, and organizational styles. The model is based upon recognition of seven barriers to church attendance and assimilation resulting from mental illness: stigma, anxiety, self-control, differences in social communication and sensory processing, social isolation and past experiences of church. Seven broad inclusion strategies are presented for helping persons of all ages with common mental health conditions and their families to fully participate in all of the ministries offered by the local church. The book is also designed to be a useful resource for parents, grandparents and spouses interested in promoting the spiritual growth of loved ones with

mental illness.

This volume is based on contributions from the First International Conference on [Recent Advances in Natural Language Processing] (RANLP95) held in Tzgov Chark, Bulgaria, 14-16 September 1995. This conference was one of the most important and competitively reviewed conferences in Natural Language Processing (NLP) for 1995 with submissions from more than 30 countries. Of the 48 papers presented at RANLP95, the best (revised) papers have been selected for this book, in the hope that they reflect the most significant and promising trends (and latest successful results) in NLP. The book is organised thematically and the contributions are grouped according to the traditional topics found in NLP: morphology, syntax, grammars, parsing, semantics, discourse, grammars, generation, machine translation, corpus processing and multimedia. To help the reader find his/her way, the authors have prepared an extensive index which contains major terms used in NLP; an index of authors which lists the names of the authors and the page numbers of their paper(s); a list of figures; and a list of tables. This book will be of interest to researchers, lecturers and graduate students interested in Natural Language Processing and more specifically to those who work in Computational Linguistics, Corpus Linguistics and Machine Translation.

In the last years we have witnessed how the field of Cosmology has experienced a metamorphosis. From being essentially the search for three numbers (the expansion rate, the deceleration parameter, and the cosmological constant), it has become a precision science. This scientific discipline is determined to unravel the most minute details of the elementary processes that took place during the most primitive stages of the Universe and also of the mechanisms driving the cosmic expansion and the growth of structures at the largest scales. To achieve these goals one needs not only the development of new experimental and observational techniques but also a deep understanding of the underlying theoretical frameworks. This book gathers the work of leading experts in these fields and provides a broad view of some of the most relevant open questions faced by Cosmology at the beginning of the twenty-first century.

Whether or not China is now a capitalist-imperialist country is an issue on which there is some considerable disagreement, even within the revolutionary left. This book brings together theoretical, definitional and logical considerations, as well as the extensive empirical evidence which is now available, to demonstrate that China has indeed definitely become a capitalist-imperialist country. Indeed, the issue is raised of whether the current world imperialist system is in fact in the early stages of bifurcating into two competing imperialist blocs, one led by the United States and the other led by China. Is China an Imperialist Country? contains extensive data on: the size and nature of the present Chinese capitalist economy; the massive and rapidly growing export of capital from China, to Africa and around the world; the very rapid expansion of the Chinese military for the purpose of 'protecting' China's foreign investment; and the dangerous and growing contention between China and other imperialist powers, especially the United States. This data is analyzed and interpreted in a Maoist framework, in order to decipher some of the implications of the past hundred years of Chinese--and world--history, for those who seek the overthrow and end to capitalism and imperialism in all its forms.

This book highlights the importance of investigating for ADHD in adults with attention difficulties, poor memory and executive function impairments. The authors advocate a neurodevelopmental assessment approach in all phases of life, and explain how to perform such assessments. The identification of ADHD in adults with other psychiatric and neurological disorders will lead to a better response to treatments, and as a result reduce its social, economic and personal burden. ADHD can no longer be considered solely a pediatric condition, as it occurs in a significant proportion of adults worldwide. However, ADHD in adults is often unrecognized and untreated. Diagnosing the disorder in adulthood is a challenge, due not only to the different clinical presentation in this phase of life, but also to the fact that other conditions may mask the symptoms. ADHD constitutes a hidden comorbidity with a detrimental impact of those affected, and a poor response (or even non-response) to several treatments. Intended for psychiatrists, neurologists, specialists in gerontology and neuropsychology, this book is an indispensable resource for all mental health practitioners who want to optimize the treatment of patients affected by psychiatric and neurological disorders who respond poorly to standard treatments.

This book employs a direct and clear approach to understanding the medications used in the treatment of psychiatric disorders. A range of areas, such as prescription errors, dosage modification in renal and hepatic dysfunction, augmentation strategies in treatment resistant patients, and recent findings from various clinical trials are addressed. Given its clear, straightforward approach, the book will be a valuable guide for all clinicians working with patients with psychiatric illness.

The surgical approach section has been completely updated to incorporate recent advances in functional neurosurgery including deep brain stimulation. The final section on non-pharmacologic therapies includes informative chapters on physical and occupational therapy, speech and swallowing evaluation and therapy, and nutrition. The second edition also incorporates new information about sleep-related movement disorders and covers treatment of Parkinson disease in greater depth. Loaded with tables, algorithms, and flow charts that illustrate key concepts, outline management of disorders, and highlight important information about diagnosis and treatment, this book is a highly useful addition to the pockets of all clinicians who work with patients with movement disorders. Key Features: Completely revised and updated second edition of popular practical resource for busy clinicians Covers medical, psychiatric, surgical, and nonpharmacologic approaches to all types of movement disorders Written concisely in expanded outline, bullet-point format for quick access to information Emphasizes diagnosis, work-up, and treatment Packed with management algorithms, tables, and flow charts outlining drug dosing, side effects, and other therapeutic regimens

Although monotherapy is generally recommended as the treatment of choice, treatment resistance of patients with psychosis, cognitive, mood and anxiety disorders represents a significant clinical problem. In this context, augmentation and combination strategies are commonly employed to address this problem. Although multiple medication use common in psychiatric practice, reasons, efficacy and safety for polypharmacy, and augmentative strategies have remained unclear. It remains unclear if there is an evidence base to support polypharmacy. Furthermore, excessive and inappropriate use of psychotropic medications has been recognized as a public health problem. This volume set is the first comprehensive, clinically oriented, reference on the multiple medication use to treat psychotic, cognitive, mood and anxiety disorders.
