Human Services (HHS) to enlist the Institute of Medicine (IOM) in examining pain as a public health problem. In this report, the IOM offers a blueprint for action in transforming prevention, care, education, and research, with the goal of providing relief for people with pain in America. To reach the vast multitude of people with various types of pain, the nation must adopt a population-level prevention and management strategy. The IOM recommends that HHS develop a comprehensive plan with specific goals,

actions, and timeframes. Better data are needed to help shape efforts, especially on the groups of people currently underdiagnosed and undertreated, and the IOM encourages federal and state agencies and private organizations to accelerate the collection of data on pain incidence, prevalence, and treatments. Because pain varies from patient to patient, healthcare providers should increasingly aim at tailoring pain care to each person's experience, and self-management of pain should be promoted. In addition, because

there are major gaps in knowledge about pain across health care and society alike, the IOM recommends that federal agencies and other stakeholders redesign education programs to bridge these gaps. Pain is a major driver for visits to physicians, a major reason for taking medications, a major cause of disability, and a key factor in quality of life and productivity. Given the burden of pain in human lives, dollars, and social consequences, relieving pain should be a national priority.

Pain in long term care is a commonality amongst older residents despite the vast options available for optimal pain management. Unrelieved pain and/or poor pain management impacts individual health care outcomes. Researcher evidence has shown that nurse practitioners improve the quality of care in long term care, but are challenged by multiple barriers that inhibit optimal pain control. The purpose of this pilot study is to explore the pain management processes used by nurse practitioners in long term care facilities to identify positive and/or negative factors that may be impacting the nurse practitioner role in providing adequate pain control. This descriptive study will utilize a retrospective, case controlled research design that will incorporate reviewing fifty-five long term care resident medical records to determine the typical processes used by nurses in obtaining adequate pain control medication within long term care facilities, and

"Chronic nonmalignant pain is a common reason for healthcare visits that result in a need to properly manage chronic pain. Chronic pain management is necessary to ensure patient outcomes are based on evidence that reflect best practice. The purpose of this study was to assess nurse practitioner knowledge of chronic nonmalignant pain in the outpatient setting. A quantitative survey-based design was used to assess knowledge. Over a four-month period in the fall and winter of 2017-2018, the members of The Michigan Council of Nurse Practitioners were surveyed on knowledge of chronic nonmalignant pain management. A total of 69 nurse practitioners participated in the study completing the KnowPain-12 survey as well as a

Independent sample t-tests and chi-square tests were completed using the following variables: the number of years in practice, gender, discipline practice specialty, and the KnowPain-12 scores. The results showed no significant relationships between any of the variables. This study provided useful information by indicating a need for more research on the topic, as well as more education regarding the management chronic nonmalignant pain. Further research is recommended to determine the variables contributing to the lack of knowledge and subsequent ways to improve knowledge. Moreover, it is recommended to include not only nurse practitioners, but also physician assistants, physicians, and

Up to 35% of adults suffer from chronic pain, and a substantial number of these patients are admitted to hospitals every year. A major concern of these patients is whether the pain will be adequately controlled during hospitalization. these patients are more likely to have poor pain control and may experience an exacerbation of their co-exisitng chronic pain condition during hospital admission. Adequate pain control is directly related to clinical outcomes, length of hospital stay, and patient satisfaction. A considerable body of evidence

demonstrates the medical, social, and economic benefits of satisfactory inpatient pain control. Currently, there are limited pain control guidelines to address this challenging inpatient population. In fact, there are no guidelines outlinign best practices for postoperative pain control in patients with chronic pain. The complex nature of chronic pain and a dearth of publications addressing the concerns of these patients make the creation of relevant guidelines difficult. The goal of this book is to equip clinicians to provide safe and effective management of hospitalized patients with co-existing chronic pain. Each chapter addresses a particular clinical question and is written by an expert in the field.

reporting and pay-for-performance reviews. Therefore, pain management has had increased recognition as an important component of high quality care and a key factor of patient satisfaction. According to a recent study, patients report being satisfied with their care/hospitalization at a 4.86 times greater rate if pain was controlled. Satisfaction is 9.92 times greater if the staff's performance with pain control was deemed appropriate. The purpose of this study was to evaluate the correlation of the Pain Target Program as compared to patient satisfaction in hospitalized post-surgical patients with acute pain. The theory of unpleasant pain symptoms guided this study. Information was gathered

Background: Chronic pain significantly impacts individuals physically, emotionally, and financially. The management of chronic pain is a complex, multi-faceted issue that includes the risk of opioid addiction and often requires a multi-disciplinary approach. Despite the numerous available treatment options, the number of patients requiring pain medications has continuously increased along with doubling overdose cases. Purposes/Methods: A quasi-experimental one-group pre-test/post-test study was conducted to evaluate the effects of a 4-hour didactic and hands-on educational session on FNP students' knowledge and attitude regarding chronic pain management. The effects of the educational session were
