This latest edition of The Pearson General Studies Manual continues to provide exhaustive study material for the General Studies paper of the UPSC Civil Services Preliminary Examination. This student-friendly book has been completely revised, thoroughly updated and carefully streamlined and is strictly exam-centric. In this new edition, a large number of new boxes and marginalia—“with additional and relevant information—“have been added to provide cutting-edge information to the aspirant. Readers will find that important facts and information have been presented in the form of well-structured tables and lists.

This book presents a comprehensive overview of the modern theory of spectral line broadening and shifting by pressure of atmospheric gases. It describes current semi-classical methods for calculating vibrotational line widths and shifts, including very recent modifications and new developments realised by the authors themselves. For most of the considered molecular systems, analytical formulae are also given, which enable the calculation of line broadening coefficients without the use of semi-classical methods. The results of calculations by various approaches are compared with experimental data available in the literature. Numerous appendices list theoretical expressions and parameters' values required for the writing of computer programs for calculation of line broadening and line shifting coefficients. The book is addressed to undergraduate and postgraduate students as well as to professional scientists and researchers working in the field of molecular physics, molecular spectroscopy, quantum chemistry and mathematical physics.

**The Atmosphere: An Introduction to Meteorology remains the standard introduction in its field, reinforcing basic concepts with everyday, easy-to-grasp examples. This revision retains the hallmarks professors have come to expect from Tarbuck and Lutgens: a friendly, largely non-technical narrative, timely coverage of recent atmospheric events, and carefully crafted artwork by leading science illustrator Dennis Tasa. The Twelfth Edition maintains a student-friendly approach while evolving to address various course challenges and trends. New digital visualization and assessment tools are now available on MyMeteorologyLab, a new resource that both encourages student self-study and enables instructors to manage their courses online, with customizable assessments for students. Each chapter in this revision is organized by a new active learning path to help guide and engage non-science majors. A greater focus on popular and increasingly important Severe & Hazardous Weather applications, new critical visual analysis Eye on the Atmosphere features, as well as new discussions of the real-world career opportunities of meteorology with Professional Profile essays, make the science both relevant and exciting.**

**There's no doubt about it: weather plays a big role in our lives. But what exactly is weather, and what causes it? Why is it sunny one day and cloudy the next? What are hail and fog? Find out how events that occur miles above Earth's surface produce different types of weather. Simple experiments give a hands-on approach to studying sunlight, air temperature, and atmospheric pressure. Also included are directions for making meteorological instruments, including a precipitation gauge and barometer. There may be no way to control the weather, but you can find out how to predict weather events and how to prepare for them.**

A Guide for the Technical Evaluation of Environmental Data presents the insight you need for evaluating analytical data obtained from environmental samples. Often, analyses performed on a few samples can lead to misplaced concern on the wrong analytes. For example, a geologist would know which trace metals might be naturally present in the source rock underlying a site, but not know which metals should be expected because of tire wear or which polynuclear aromatic hydrocarbons would be present because of a nearby powerplant. This book provides you with references to support decision making regarding selection of contaminants.
