As this bestseller predicted, Trump has only grown more erratic and dangerous as the pressures on him mount. This new edition includes new essays bringing the book up to date—because this is still not normal. Originally released in fall 2017, The Dangerous Case of Donald Trump was a runaway bestseller. Alarmed Americans and international onlookers wanted to know: What is wrong with him? His administration has proven as chaotic and destructive as its opponents feared, and the man at the center of it all remains a cipher. Constrained by the APAs' "Goldwater rule," which inhibits mental health professionals from diagnosing public figures they have not personally examined, many of those qualified to weigh in on the issue have shied away from discussing it at all. The public has thus been left with a vacuum of information. The prestigious mental health experts who have contributed to the revised and updated version of The Dangerous Case of Donald Trump argue that their moral and civic "duty to warn" supersedes professional neutrality. Whatever affects him, affects the nation: From the trauma people have experienced under the Trump administration to the cult-like characteristics of his followers, he has created a crisis across our nation and beyond. With eight new essays (about one hundred pages of new material), this edition will cover the dangerous ramifications of Trump's unnatural state. It's not all in our heads. It's in his.

Professional, reassuring advice for coping with the disorder and breaking the destructive cycle

Living with Borderline Personality Disorder

People with personality disorders are all around us, though many times we're not aware of those who are overly paranoid, obsessive-compulsive, antisocial, or overly dependent until it's too late. Indeed, many sufferers aren't aware themselves of their disorders and often go undiagnosed and untreated, leading to problems in their personal and professional lives. Here, Dobbert offers an introduction to the most common personality disorders, and a guide for those who work, live, or come in contact with sufferers on a daily basis.

In this authoritative edited volume, leading researchers and clinicians explore the premise that the Five-Factor Model (FFM) of personality is the most useful and comprehensive taxonomy for describing personality and for assessing and describing personality disorders. Although the FFM has already been productively applied to the study of normal personality, it is now proposed as an alternative, conceptually useful framework for understanding personality disorders. This book provides a comprehensive examination of both diagnostic and [psychotherapeutic and other] treatment issues of personality disorders, includes practical guidance for using standardized instruments to assess personality, and underscores the utility of the FFM's dimensional approach for understanding personality and personality disorders.

Understanding the problem. The clinical picture -- "Personality" and more -- Causes. The four faces of borderline personality disorder -- What the person has; the disease perspective -- The dimensions of borderline personality disorder -- Behaviors I: addiction and eating disorders -- Behaviors II: self-harming behaviors and dissociation -- The life story: childhood experiences, development, trauma -- Treatment. Treating the disease -- Treating the behaviors -- Understanding the dimensions and addressing the life story -- Treatment approaches: putting it all together -- Themes and variations -- How to cope, how to help. If you've been diagnosed with borderline personality disorder -- For parents, partners, friends, and co-workers.

Borderline personality disorder is a serious mental illness marked by unstable moods, behavior, and relationships. In 1980, the Diagnostic and Statistical Manual for Mental Disorders, Third Edition (DSM-III) listed borderline personality disorder as a diagnosable illness for the first time. Most psychiatrists and other mental health professionals use the DSM to diagnose mental illnesses.

Because some people with severe borderline personality disorder have brief psychotic episodes, experts originally thought of this illness as atypical, or borderline, versions of other mental disorders. While mental health experts now generally agree that the name "borderline personality disorder" is misleading, a more accurate term does not exist yet.

Sometimes I Act Crazy

When mental illness is not enough to preclude a defendant from death-eligibility, mental health information presented during the sentencing phase of a capital trial becomes incredibly important. The role of personality disorders as a mitigating factor is missing from the literature, despite high comorbidity rates with criminal behavior. The goal of this study was to examine whether personality disorders are treated differently than other mental illnesses that may be presented as mitigating evidence and if that affects sentencing recommendations. Two samples of 158 judges and 195 mock jurors were each randomized into five conditions. Using vignettes, the defendant's diagnosis (no mental illness, schizophrenia, bipolar I disorder, antisocial personality disorder, or borderline personality disorder) was manipulated. Results showed that judges and mock jurors found schizophrenia to be more mitigating than any other mental health diagnosis, but judges recognized that borderline personality disorder is also mitigating.

This latest volume offers a common language for clinicians involved in the diagnosis and study of mental disorders and facilitates an objective assessment of symptom presentations across a variety of clinical settings--inpatient, outpatient, partial hospital, consultation-liaison, clinical, private practice, and primary care. Living with Borderline Personality Disorder

People with personality disorders are all around us, though many times we're not aware of those who are overly paranoid, obsessive-compulsive, antisocial, or overly dependent until it's too late. Indeed, many sufferers aren't aware themselves of their disorders and often go undiagnosed and untreated, leading to problems in their personal and professional lives. Here, Dobbert offers an introduction to the most common personality disorders, and a guide for those who work, live, or come in contact with sufferers on a daily basis.

In this authoritative edited volume, leading researchers and clinicians explore the premise that the Five-Factor Model (FFM) of personality is the most useful and comprehensive taxonomy for describing personality and for assessing and describing personality disorders. Although the FFM has already been productively applied to the study of normal personality, it is now proposed as an alternative, conceptually useful framework for understanding personality disorders. This book provides a comprehensive examination of both diagnostic and [psychotherapeutic and other] treatment issues of personality disorders, includes practical guidance for using standardized instruments to assess personality, and underscores the utility of the FFM's dimensional approach for understanding personality and personality disorders.

Borderline personality disorder is a serious mental illness marked by unstable moods, behavior, and relationships. In 1980, the Diagnostic and Statistical Manual for Mental Disorders, Third Edition (DSM-III) listed borderline personality disorder as a diagnosable illness for the first time. Most psychiatrists and other mental health professionals use the DSM to diagnose mental illnesses.

Because some people with severe borderline personality disorder have brief psychotic episodes, experts originally thought of this illness as atypical, or borderline, versions of other mental disorders. While mental health experts now generally agree that the name "borderline personality disorder" is misleading, a more accurate term does not exist yet.

Sometimes I Act Crazy

When mental illness is not enough to preclude a defendant from death-eligibility, mental health information presented during the sentencing phase of a capital trial becomes incredibly important. The role of personality disorders as a mitigating factor is missing from the literature, despite high comorbidity rates with criminal behavior. The goal of this study was to examine whether personality disorders are treated differently than other mental illnesses that may be presented as mitigating evidence and if that affects sentencing recommendations. Two samples of 158 judges and 195 mock jurors were each randomized into five conditions. Using vignettes, the defendant's diagnosis (no mental illness, schizophrenia, bipolar I disorder, antisocial personality disorder, or borderline personality disorder) was manipulated. Results showed that judges and mock jurors found schizophrenia to be more mitigating than any other mental health diagnosis, but judges recognized that borderline personality disorder is also mitigating.
