The earliest forms of phlebotomy can be traced all the way back to the ancient Egyptian civilization, and ancient Greek and Roman cultures. Back in ancient times, the removal of blood from the body was less of a science than a way of supposedly ridding the body of "evil spirits" or illnesses. Draining blood, in ancient times, was considered one way to effectively cure the body of most ills, and was often performed using a lancet tool. In today's modern times, bloodletting is no longer practiced, except in rare instances of cases of extremely rare diseases. Today's methods of Phlebotomy are considered a science, and one must receive a degree or certification in phlebotomy in order to perform blood drawing tasks. Today, Phlebotomy procedures are only practiced in safe environments such as hospitals, doctor's offices, and medical clinics. THIS TEXT CONTAINS OVER 300 PLUS GENERAL TEST QUESTIONS AND ANSWERS!!!!

Phlebotomy uses large, hollow needles to remove blood specimens for lab testing or blood donation. Each step in the process carries risk both for patients and health workers. Patients may be bruised. Health workers may receive needle-stick injuries. Both can become infected with bloodborne organisms such as hepatitis B, HIV, syphilis or malaria. Moreover, each step affects the quality of the specimen and the diagnosis. A contaminated specimen will produce a misdiagnosis. Clerical errors can prove fatal. The new WHO guidelines provide recommended steps for safe phlebotomy and reiterate accepted principles for drawing, collecting blood and transporting blood to laboratories/blood banks.
