Grade 11 `Teacher's Guide

***Physical inactivity is a key
determinant of health
across the lifespan. A lack
of activity increases the***

risk of heart disease, colon and breast cancer, diabetes mellitus, hypertension, osteoporosis, anxiety and depression and others diseases. Emerging literature has suggested

that in terms of mortality, the global population health burden of physical inactivity approaches that of cigarette smoking. The prevalence and substantial disease risk associated with

physical inactivity has been described as a pandemic. The prevalence, health impact, and evidence of changeability all have resulted in calls for action to increase physical activity

across the lifespan. In response to the need to find ways to make physical activity a health priority for youth, the Institute of Medicine's Committee on Physical Activity and

Physical Education in the School Environment was formed. Its purpose was to review the current status of physical activity and physical education in the school environment,
