This book explains both the basic science and the applications of biotechnology-derived pharmaceuticals, with special emphasis on their clinical uses. The foundations of pharmaceutical biotechnology lie mainly in the capability of plants, microorganism, and animals to produce low and high molecular weight compounds useful as therapeutics.

Pharmaceutical biotechnology has flourished since the advent of recombinant DNA technology and metabolic engineering,

supported by the well-developed bioprocess technology. A large number of monoclonal antibodies and therapeutic proteins have been approved, delivering meaningful contributions to patients' lives, and the techniques of biotechnology are also a driving force in modern drug discovery. Due to this rapid growth in the importance of biopharmaceuticals and the techniques of biotechnologies to modern medicine and the life sciences, the field of pharmaceutical biotechnology has become an increasingly important component in the education of pharmacists and pharmaceutical scientists. This book will serve as a complete one-stop source on the subject for undergraduate and graduate pharmacists, pharmaceutical science students, and

The two main goals of the symposium upon which this volume is based were 1) to cement together knowledge presently available in the field of antibodies to steroids and obtainable only under separate covers in different journals and books, and 2) to present new data which could lead to a more complete understanding of physiologic phenomena like those occurring during the menstrual cycle, or to the elucidation of the mechanisms involved in steroid-protection interaction, or to the practical application of immunologic techniques to measurements of steroid hormones. These techniques are extremely sensitive and can measure levels of steroid on the same order of magnitude as the radioisotope methods.

However, the latter are much more laborious and costly which limits their use in many cases to the research laboratory. But the immunologic techniques generally classified as radioimmunoassay, are fraught with difficulties and problems which must be overcome. Fortunately, perhaps, the subject of immunologic techniques as applied to steroid determination is the child of radioimmunoassay of proteins, so to speak. Many of the problems which confront the former have been resolved in the latter instance. Thus, we are in an advantageous position because we are aware of the biologic and technical problems of the earlier radioimmunoassay techniques. Similar experiences have been reported in the book about the use of immunologic techniques for determination of steroid
