This report investigates: the governance of the BBC's commercial arm, BBC Worldwide; the activities of BBC Worldwide, including programme sales, production, magazines and websites; BBC Worldwide's acquisition of Lonely Planet; and the possible partnership between BBC Worldwide and Channel 4. There are major benefits from the BBC undertaking commercial activities: the profits generated by the exploitation of the BBC's intellectual property can be reinvested in the BBC's public services, to the benefit of licence fee payers. But the manner in which some of the BBC's commercial revenue is generated, and the governance arrangements within which the BBC Worldwide operates, causes increasing concern. Worldwide has proved successful in recent years in exploiting new commercial opportunities, made possible by a loosening of the rules that govern the limits to its operations. However, there a balance to be drawn between Worldwide generating a return for the BBC, and limiting Worldwide's operations in order to ensure it upholds the BBC's reputation and does not damage its commercial competitors. Worldwide's minority stakes in overseas production companies, its controversial acquisition of Lonely Planet, and its growing portfolio of magazines, suggest that the balance has been tipped too far in favour of Worldwide's unrestricted expansion, jeopardising the reputation of the BBC and having an adverse impact on its commercial competitors. It is in the interests of

the UK's creative economy as a whole that BBC Worldwide's activities are reined back. The BBC Trust should reinstate the rule that all BBC commercial activity must have a clear link with core BBC programming.

Advances in Geosciences is the result of a concerted effort to bring together the latest results and planning activities related to earth and space science in Asia and the international arena. The volume editors are all leading scientists in their research fields covering six sections: Atmospheric Science (AS), Hydrological Science (HS), Ocean Science (OS), Solid Earth (SE), Solar Terrestrial (ST) and Planetary Science (PS). The main purpose is to highlight the scientific issues essential to the study of earthquakes, tsunamis, atmospheric dust storms, climate change, drought, flood, typhoons, monsoons, space weather, and planetary exploration. Abraham Ibn Ezra on Elections, Interrogations, and Medical Astrology

This book addresses the crucial question of how the essential needs of the growing human population can be met without breaking the Earth's already-stretched life-support system. With four out of five people predicted to be urban dwellers by 2080, 'One Planet' Cities proposes a pathway to genuine sustainability for cities and neighbourhoods, using an approach based on contraction and convergence.

Utilising interviews with key players, including the Global Footprint Network, World Future Council, WWF, mayors and government officials, and case studies from across the globe, including Europe, North and South America, Australia, South Africa, China and India, David Thorpe examines all aspects of modern society from food provision to neighbourhood design, via industry, the circular economy, energy and transport through the critical lens of the ecological footprint and relevant supporting international standards and indicators. Recommendations on managing supply chains and impacts, how the transition to a world within limits might be financed, and a deep examination of the Welsh Government's pioneering efforts follow. It concludes with an imagined vision of what a genuinely sustainable future might be like, and an appeal for 'one planeters' everywhere to step up to the challenge. This book will be of great interest to practitioners and policymakers

involved in governance, administration, urban environments and sustainability, alongside students of the built environment, urban planning, environmental policy and energy.

Representatives of several scientific communities, such as planetary scientists, astronomers, space physicists, chemists and astrobiologists have met with the aim to review the knowledge on four major themes: (1) the study of the formation and evolution processes of the outer planets and their satellites, beginning with the formation of compounds and planetesimals in the solar nebula, and the subsequent evolution of the interiors of the outer planets, (2) a comparative study of the atmospheres of the outer planets and Titan, (3) the study of the planetary magnetospheres and their interactions with the solar wind, and (4) the formation and properties of satellites and rings, including their interiors, surfaces, and their interaction with the solar wind and the magnetospheres of the outer planets.

Beyond these topics, the implications for the prebiotic chemical evolution on Europa and Titan are reviewed. At the time of publication, the study of the outer planets is particularly motivated by the fact that the Saturn system is being investigated by the Cassini-Huygens mission.

This Open Access book deals with the pressing question of how to achieve transformational change that reconciles development with environmental sustainability. It particularly focuses on the role of evaluation in finding sustainable

solutions. Environment and development are closely interlinked, as are human health and ecosystem health. The pandemic that began in 2020 demonstrated in no uncertain terms how destruction of habitats has allowed hitherto unknown pathogens spill over to humans wreaking havoc on people's lives and livelihoods. We are already seeing the impacts of global climate change in terms of heatwaves, forest fires and increased storms. The Sustainable Development Goals (SDGs) explicitly recognize the equal importance of the social, economic and environmental dimensions of development. In these turbulent times, when humankind faces multiple complex challenges it is essential to know that our responses are effective and that they make a positive difference. Evaluation can provide invaluable lessons to how we design policies, strategies and programs and how we allocate limited resources between competing priorities. This book brings together key thinkers and practitioners from the public and private sectors, from major multilateral organizations and from bilateral donor agencies, to present the latest knowledge and experience on how to evaluate interventions in the nexus of environment and development. The book does not promote any particular approach or methodology, but rather emphasizes the need for mixed methods to address the question at hand in the best and most suitable manner. It covers cases from a variety of fields, from climate change mitigation and adaptation, energy efficiency and renewable energy, natural resources management, biodiversity conservation and more. This book is not

a conference proceedings although it has its roots in the Third International Conference on Evaluating Environment and Development organized by the GEF Independent Evaluation Office in October 2019. The conference brought together a larger number of established and upcoming evaluators, researchers and evaluation users from the Global North and South, representing a wide variety of organizations, to discuss the frontiers of environment and development evaluation. Following the conference, the editors identified and contacted the participants who made key contributions at the conference and asked them to develop their ideas and papers into book chapters according to a coherent plan.

Fifth Report of Session 2008-09; Report, Together with Formal Minutes, Oral and Written Evidence

Do You Ever Wonder what's wrong (or right) with living on this planet? Why we're here? What we're supposed to be doing? Mildred Maiorino has wondered a lot over her four score plus years. Unlike some people, she got

some answers. When you come to know Mildred you begin to understand that she's been to some pretty interesting places-and not all of them are exactly located in what you'd call the "physical" world. She has the rare gift of being able to "see" more than most people. And she has the ability to relate the intricacies of what she's seen, heard and experienced in plain language, as if she's just talking to a friend. Which, in fact, she does as she relates what she's learned about life in Open Heart Surgery for the Planet. This is one of those books you can open to any page and gain understandable answers to some pretty heady questions. There is no beginning, and, really, no end to this work. It is a never-ending story of how to look at life so you can live more successfully, more happily, more fulfilled in a world that arguably can use some help.

Are we alone in the universe? How did life arise on our planet? How do we search for life beyond Earth? These profound questions excite and intrigue broad cross sections of science and society. Answering these questions is the province of the emerging, strongly interdisciplinary field of astrobiology. Life is inextricably tied to the formation, chemistry, and evolution of its host world, and multidisciplinary studies of solar system worlds can provide key insights into processes that govern planetary

habitability, informing the search for life in our solar system and beyond. Planetary Astrobiology brings together current knowledge across astronomy, biology, geology, physics, chemistry, and related fields, and considers the synergies between studies of solar systems and exoplanets to identify the path needed to advance the exploration of these profound questions. Planetary Astrobiology represents the combined efforts of more than seventy-five international experts consolidated into twenty chapters and provides an accessible, interdisciplinary gateway for new students and seasoned researchers who wish to learn more about this expanding field. Readers are brought to the frontiers of knowledge in astrobiology via results from the exploration of our own solar system and exoplanetary systems. The overarching goal of Planetary Astrobiology is to enhance and broaden the development of an interdisciplinary approach across the astrobiology, planetary science, and exoplanet communities, enabling a new era of comparative planetology that encompasses conditions and processes for the emergence, evolution, and detection of life. The ideal textbook resource to support a one-semester capstone course in planetary processes for geoscience undergraduates.

Martian Metamorphoses

Is the Earth the right model and the only universal key to understand habitability, the origin and maintenance of life? Are we able to detect life elsewhere in the universe by the existing techniques and by the upcoming space missions? This book tries to give answers by focusing on environmental properties, which are playing a major role in influencing planetary surfaces or the interior of planets and satellites. The book gives insights into the nature of planets or satellites and their potential to harbor life. Different scientific disciplines are searching for the clues to classify planetary bodies as a habitable object and what kind of instruments and what kind of space exploration missions are necessary to detect life. Results from model calculations, field studies and from laboratory studies in planetary simulation facilities will help to elucidate if some of the planets and satellites in our solar system as well as in extra-solar systems are

potentially habitable for life.

COMIC BOOK ARTIST SPECIAL EDITION #2 compiles the new “extras” from CBA Collection Vol. 1-3, including an unpublished story by JACK KIRBY, unpublished art by BERNIE WRIGHTSON, an unused story by JEFF JONES, an extensive new interview with ALAN WEISS, an in-depth examination of Steve Englehart and Marshall Rogers' Batman masterpieces from the 1970s, a comprehensive look at DC's rarely seen Cancelled Comics Cavalcade (perhaps the most collectible DC Comic of that decade), a Paul Gulacy art gallery, Bob Rozakis on writing the infamous Hostess Twinkie ads, Marvel Value Stamp history, Mr. Monster's scrapbook, and more!

A fascinating account of the pioneering astronomer who claimed (erroneously) to have discovered a planet outside the solar system. There are innumerable planets revolving around innumerable stars across our galaxy. Between 2009 and 2018, NASA's Kepler space telescope discovered thousands of them. But exoplanets—planets outside the solar system—appeared in science fiction before they appeared in telescopes. Astronomers in the early decades of the twentieth century spent entire careers searching for planets in other

stellar systems. In The Lost Planets, John Wenz offers an account of the pioneering astronomer Peter van de Kamp, who was one of the first to claim discovery of exoplanets. Van de Kamp, working at Swarthmore College's observatory, announced in 1963 that he had identified a planet around Barnard's Star, the second-closest star system to the Sun. He cited the deviations in Barnard's star's path—"wobbles" that suggested a large object was lurching around the star. Van de Kamp became something of a celebrity (appearing on a television show with "Mr. Wizard," Don Henry), but subsequent research did not support his claims. Wenz describes van de Kamp's stubborn refusal to accept that he was wrong, discusses the evidence found by other researchers, and explains recent advances in exoplanet detection, including transit, radial velocity, direct imaging, and microlensing. Van de Kamp retired from Swarthmore in 1972, and died in 1995 at 93. In 2009, Swarthmore named its new observatory the Peter van de Kamp Observatory. In the 1990s, astronomers discovered and confirmed the first planet outside our solar system. In 2018, an exoplanet was detected around Barnard's Star—not, however, the one van de Kamp thought he had discovered in 1963.

Practitioners like you have been turning to Micozzi's comprehensive CAM text for the past 20 years. Filled with the most up-to-date information on scientific theory and research and updated contributions from world experts, Fundamentals of Complementary and Alternative Medicine, 5th Edition gives you a solid foundation of the therapies and

evidence-based clinical applications for CAM – and expands your global perspective with new and updated chapters on healing systems from around the world. Dive into interesting discussions on massage, manual therapies and bodywork, yoga, chiropractic, osteopathy, herbal medicine, aromatherapy and essential oils therapy, "nature cure," naturopathy and naturopathic medicine, and nutrition and hydration. With its wide range of topics, this 20th anniversary edition is your ideal CAM reference! • A broad perspective traces CAM therapies from their beginnings to present day practices. • Clinical guides for selecting therapies, and new advances for matching the appropriate therapy to the individual patient, enables you to offer and/or recommend individualized patient care. • Expert contributors include well-known writers such as Kevin Ergil, Patch Adams, Joseph Pizzorno, and Marc Micozzi himself. • A unique synthesis of information, including historical usage, cultural and social analysis, current basic science theory and research, and a wide range of

clinical investigations and observations, makes this text a focused, authoritative resource. • Suggested readings and references in each chapter list the best resources for further research and study. • Coverage of CAM therapies and systems includes those most commonly encountered or growing in popularity, so you can carefully evaluate each treatment. • An evidence-based approach focuses on treatments best supported by clinical trials and scientific evidence. • Observations from mechanisms of action to evidence of clinical efficacy answers questions of how, why, and when CAM therapies work. • Global coverage includes discussions of traditional healing arts from Europe, Asia, Africa, and the Americas. • NEW! Updated chapters feature new content and topics, including: challenges in integrative medicine, legal issues, CAM in the community, psychometric evaluation, placebo effect, stress management, and much more! • NEW! Updated guides on common herbal remedies in clinical practice, East and Southeast Asia, and native North and South America deliver

the latest information. • NEW! Revised chapters with new contributors offer fresh perspectives on these important and relevant topics. • EXPANDED! Basic science content and new theory and research studies cover a wide range of sciences such as biophysics, biology and ecology, ethnomedicine, psychometrics, neurosciences, and systems theory. • NEW! New and expanded global ethnomedical systems include new content on Shamanism and Neo-Shamanism, Central and North Asia, Southeast Asia, Nepal and Tibet, Hawaii and South Pacific, Alaska and Pacific Northwest, and contemporary global healthcare.

The Nature of Planets

It's fairly obvious that one can't be a 'perfect' environmentalist. But that's okay. Perfection isn't the goal. A good life is. And a good life has as much to do with your intent as with the end result." —from the Introduction The Newman's Own Organics Guide to a Good Life is the essential book for those of us who can't live in an organic hemp tepee but do care about our quality of life, global warming, clean water, and disappearing resources. Nell Newman shows you how to do what is within easy reach. Along with realistic, practical advice, she shows how and why living a more environmentally conscious life benefits you and your immediate surroundings. In addition to recycling and reusing, the book covers consumer-related steps such as • how buying and eating organic food supports small farms (and tastes better, too) • how

you can buy clean power through your regular power company • which long-distance telephone companies offer competitive pricing and service while returning a portion of their profits to environmental and educational organizations • where to buy everything—from pots and pans to pet food—so that you can “vote with your dollar” and feel good about your purchases Packed with profiles of fascinating—and sometimes zany—people and a heavy dose of sanity, this book is organized according to the way you really live, making it easy to identify what areas of change are viable for you. A resource directory of publications, retailers, groups, and associations is included in the back of the book.

A newly updated and revised comprehensive book of herbal and oil correspondences for all of your magickal ritual and spell works.

Nuclear planetary science has come to play an important role in our understanding of the origin and evolution of the planetary bodies in our solar system. A newly established branch of planetary science, its study aids in humankind's exploration of the present states of the structures of various planetary bodies (including the Earth), their atmospheres and their satellites, as well as small celestial bodies (e.g. asteroids), through direct observation. Knowing the elemental composition of the planetary bodies is essential in order to understand the formation and evolution of planetary bodies — just as important as it is to know the mass, radius, density and orbit of the celestial body. Suitable for students and specialists interested in the much wider field of Earth

and Planetary Science, topics related to the planets and asteroids in the solar system are dealt with in this book. Techniques related to nuclear planetary science's nuclear cosmochemical and geological methods are also covered in this book.

This volume offers the first critical edition, with English translation and commentary, of seven astrological treatises by Abraham Ibn Ezra: the Book of Elections (3 versions); the Book of Interrogations (3 versions); and the Book of the Luminaries.

Exoplanet research is one of the most explosive subjects in astronomy today. More than 500 exoplanets are now known, and groups world-wide are actively involved in a broad range of observational and theoretical efforts. This book ties together these many avenues

of investigation - from the perspectives of observation, technology and theory - to give a comprehensive, up-to-date review of the entire field. All areas of exoplanet investigation are covered, making it a unique and valuable guide for researchers in astronomy and planetary science, including those new to the field. It treats the many different techniques now available for exoplanet detection and characterisation, the broad range of underlying physics, the overlap with related topics in solar system and Earth sciences, and the concepts underpinning future developments. It emphasises the interconnection between the various fields and provides extensive references to more in-depth treatments and reviews.

Planetary Volcanism across the Solar System compares and contrasts the vast array of planetary bodies in the Solar System, including Earth. The wealth of spacecraft data for almost all major solid-surface bodies in the Solar System indicate that volcanism has been a dominant mechanism in shaping the landscapes of these bodies. The book addresses key questions surrounding our understanding of planetary volcanism, such as how to integrate the data into a coherent view of how volcanic activity arises, how this mechanism shapes planets, which volcanic landforms are ubiquitous throughout the Solar System, and which are unique. By placing a singular emphasis on comparing volcanic processes and landforms on all relevant Solar System bodies, and with the explicit objective of providing a systems-level understanding of this widespread phenomenon, users will find an up-to-

date, accessible and comprehensive discussion of the major volcanic processes and landforms that shape and drive the evolution of planets, moons and smaller bodies. Includes an introduction placing the book in the context of the larger Comparative Planetology series Compares volcanic processes and landforms on all relevant Solar System bodies, providing a systems-level understanding of this widespread phenomenon Offers a thorough examination of the major volcanic processes and landforms that shape and drive the evolution of planets, moons and smaller bodies Includes information from new mission data and discoveries in recent years Features over 100 color illustrations and charts to more clearly convey concepts Offers additional online content, including figures, animations, video, and other multimedia content such as interviews with contributing authors

This book approaches geological, geomorphological and topographical mapping from the point in the workflow at which science-ready datasets are available. Though there have been many individual projects on dynamic maps and online GISs, in which coding and data processing are given precedence over cartographic principles, cartography is more than “just” processing and displaying spatial data. However, there are currently no textbooks on this rapidly changing field, and methods tend to be shared informally. Addressing this gap in the literature, the respective chapters outline many topics pertaining to cartography and mapping such as the role and definition of planetary cartography and (vs?) Geographic Information Science; theoretical background and practical methodologies in geological mapping; science-ready versus public-ready products; a goal/procedure-focused practical manual of the most commonly used software in planetary mapping, which includes generic (ArcGIS and its extensions, JMARS) and specific tools (HiView, Cratertools etc.); extracting topographic information from images; thematic mapping: climate; geophysics; surface modeling; change detection; landing site selection; shared maps; dynamic maps on the web; planetary GIS interfaces;

crowdsourcing; crater counting techniques; irregular bodies; geological unit symbology; mapping center activities; and web services. All chapters were prepared by authors who have actually produced geological maps or GISs for NASA / the USGS, DLR, ESA or MIIGAİK. Taken together, they offer an excellent resource for all planetary scientists whose research depends on mapping, and for students of astrogeology.
