Policymakers, farmers, managers of agriculture and others look to agricultural economists for accurate estimates of the costs and returns of individual agricultural commodities. But there is great diversity and disagreement among practitioners about the best method for such analysis. The contributors to this volume explore how different uses of estimates determine different methods of estimation, as well as evaluating what the preferred methods are for similar uses.

This glossary will be a privileged tool of translators, experts and all those working in the field of social issues. About 1500 primary entries and a total of 28 500 terms contribute to make this glossary a comprehensive compilation in the field of social security.

How is the world's workforce (ERP) suppliers develop software? How do Oracle, SAP, Microsoft and Co really work? Christine Grimm presents a first-hand account of a social researcher who entered the software laboratory of one of the biggest ERP providers. Presenting an in-depth ethnography on how people act within such labs, she reveals the highly unexpected social character of programming and shows how the vendor reorganizes himself to find new ways to respond to the expectations of the market. Furthermore, the author highlights the informal practices when an ERP system, as a defective or incomplete product, re-enters the supplier's labs. The book provides a window into what happens if bugs are dug up and emotions on both the supplier and customer sides are running high.

Bond and Money Markets: Strategy, Trading, Analysis explains and analyses all aspects of the bond and money markets and is both an introduction for newcomers and an advanced text for experienced market practitioners and graduate students. Those with experience of the industry at all levels will find the book invaluable as a standard reference work. The book features coverage of: Government and Corporate bonds, Eurobonds, callable bonds, convertibles Asset-backed bonds including mortgages and CDOs Derivative instruments including bond futures, swaps, options, structured products, and option valuation models Interest-rate risk, duration analysis, convexity, and the convexity bias The money markets, repo markets, basis trading, and asset / liability management Term structure models, estimating and interpreting the yield curve Portfolio management, including total return framework, portfolio strategies, and constructing bond indices and valuable insight into: Trading and hedging strategy Charting and technical analysis The latest market developments, such as value-at-risk, and credit derivatives Emerging markets and the benefits of international investment The Bond and Money Markets: Strategy, Trading, Analysis is aimed at a wide readership including bond salespersons, traders, corporate financiers and graduate trainees, as well as risk managers, operations professionals and business analysts. Other market participants including fund managers, corporate treasurers, management consultants, regulators and financial journalists will also find the content useful. This book is virtually a stand alone reference book on interest rate swaps, the money markets, financial market mathematics, interest-rate futures and technical analysis Includes some introductory coverage of vary specialised topics (for which one requires specialised texts) such as VaR, Asset & liability management, credit derivatives Combines accessible style with advanced level topics, plus review of latest research

Many business corporations are faced with the challenge of bringing together quite different types of knowledge in design processes: knowledge of different disciplines in the natural and engineering sciences, knowledge of markets and market trends, knowledge of political and judicial affairs. This also means a challenge for design methodology as the academic discipline that studies design processes and methods. The aim of the NATO ARW of which this book is the report was to bring together colleagues from different academic fields to discuss this increasing multidisciplinary in the relationship between design and sciences. This multidisciplinary made the conference a special event. At a certain moment for the participants exclaimed: "This is not a traditional design methodology conference!" Throughout the conference it was evident that there was a need to develop a common language and understanding to enable the exchange of different perspectives on design and its relationship with science. The contributors that have been included in this book show these different perspectives: the philosophical, the historical, the engineering perspective and the practical designer's experience.

This two volume Handbook contains chapters on the main areas to which Post-Keynesians have made sustained and important contributions. These include theories of accumulation, distribution, pricing, money and finance, international trade and capital flows, the environment, methodological issues, criticism of mainstream economics and Post-Keynesian policies. The Introduction outlines what is in the two volumes, in the process placing Post-Keynesian procedures and contributions in appropriate contexts.

The Netherlands is an unusual nation in many ways. It is not only that nearly half her land is below sea level. Nor is it that she is one of the world's most crowded lands; her more than 13 million people create a population density of about 1000 per square mile. Nor is it that half her national income is dependent upon world trade. Nor is it that so small a nation could achieve peace and prosperity with so little natural resources. What is most unusual is that the Netherlands has made such a rapid and total adjustment to the demands of modern technological society. In no small measure this was achieved by a deliberate policy of planning, direction, control and development. Its postwar history tells how a determined people under intelligent government leadership rose from a broken economy to a level of economic and social development that places their society among the most modern in the world. The Netherlands is a success stor} that in some measure has been overlooked by a wider world. This will be an attempt to record her story, touching upon some of the causes and results of this success. The Netherlands is undoubtedly one of the most planning conscious of modern nations. This is not to say that the Dutch government or its people have any concept comparable to the totality of Soviet Five Year It might be more accurate to see Dutch planning as similar to planning.

*This Seventh Edition of Donald Reifer's popular, bestselling tutorial summarizes what software project managers need to know to be successful on the job. The text provides pointers and approaches to deal with the issues, challenges, and experiences that shape their thoughts and performance. To accomplish its goals, the volume explores recent advances in dissimilar fields such as management theory, acquisition management, globalization, knowledge management, licensing, motivation theory, process improvement, organization dynamics, subcontract management, and technology transfer. Software Management provides software managers at all levels of the organization with the information they need to know to develop their software engineering management strategies for now and the future. The book provides insight into management tools and techniques that work in practice. It also provides sufficient instructional materials to serve as a text for a course in software management. This new edition achieves a balance between theory and practical experience. Reifer systematically addresses the skills, knowledge, and abilities that software managers, at any level of experience, need to have to practice their profession effectively. This book contains original articles by leaders in the software management field written specifically for this tutorial, as well as a collection of applicable reprints. About forty percent of the material in this edition has been produced specifically for the tutorial. Contents: * Introduction * Life Cycle Models * Process Improvement * Project Management * Planning Fundamentals * Specialized Estimation*

This is the fourth version of a model that five years ago we set out to build and estimate along the lines of the continuous time approach clarified in chapter 1. Previous versions appeared in journal articles and conference proceedings, where the space is notoriously limited. Therefore we welcome the possibility of publishing a book-length treatment of this fourth version, so that we can describe its theoretical and empirical aspects in some detail. Although we have worked closely together and accept joint responsibility for the whole book, chs. 1 and 2 and appendix I have been written by G. Gandolfo, whilst chs. 3 and 4 and appendix II have been written by P.c. Padoan. Different parts of this version of the model have been discussed in various lectures at the European University Institute (Florence) in 1984. In a seminar organized by the Bank of Italy (Sadiba, Perugia, Italy, February 16-18, 1984), in the second Viennese Workshop on Economic Applications of Control Theory (Vienna, May 16-18, 1984), and in the sixth annual Conference of the Society for Economic Dynamics and Control (Nice, France, June 13-15, 1984). In all of these we received helpful comments; similarly helpful were the comments of Clifford R .. Wymer, who, however, is absolved of any responsibility.

Many systems development practitioners find traditional "one-size-fits-all" processes inadequate for the growing complexity, diversity, dynamism, and assurance needs of their products and services. The Incremental Commitment Spiral Model (ICSM) responds with a principle- and risk-based framework for defining and evolving your project and corporate process assets. This book explains ICSM's framework of decision criteria and principles, and shows how to apply them through relevant examples.

The aim of this book is to bring methods of land-market and land-price analysis to the foreground. It relates substantive research findings for land and urban development and blends these with a focus on research design and methodology. Its findings have relevance beyond the topics of housing and land: it broaches the whole question of how research design and general approach may lead to fundamentally different findings, different priorities, and different policy prescriptions and preoccupations. It is based on work done in the Third World, but is also relevant to studies of the industrialized world.

Supported by real world case studies and input from industry experts, the book looks at the business topics you need to understand to become an independent software developer. From the initial steps of identifying how you can make a profit with your software development skills, through to making your first sale and managing your projects, you will learn how to manage each of the major steps involved in becoming a self employed software developer – whether you decide to go freelance, take up contracting or develop your own product. Written specifically for software and web developers, the book identifies how business issues have a direct impact on code patterns used in software projects. Learn how to build your code to support your business model and with safety features to protect against potential threats that may emerge from the changing business environment. Style and approach This book is a detailed guide to self employment for software and web developers , covering major topics from identifying your target market and business model, through to managing your time, finances and client behavior.

From Nobel Prize-winning economist and New York Times bestselling author Robert Shiller, a groundbreaking account of how stories help drive economic events—and why financial panics can spread like epidemic viruses **Stories people tell—about financial confidence or panic, housing booms, or Bitcoin—can go viral and powerfully affect economies, but such narratives have traditionally been ignored in economics and finance because they seem anecdotal and unscientific. In this groundbreaking book, Robert Shiller explains why we ignore these stories at our peril—and how we can begin to take them seriously. Using a rich array of examples and data, Shiller argues that studying popular stories that influence individual and collective economic behavior—what he calls "narrative economics"—may vastly improve our ability to predict, prepare for, and lessen the damage of financial crises and other major economic events. The result is nothing less than a new way to think about the economy, economic change, and economics. In a new preface, Shiller reflects on some of the challenges facing narrative economics, discusses the connection between disease epidemics and economic epidemics, and suggests why epidemiology may hold lessons for fighting economic contagions.**

The "HERMES" European system of models is featured in this book. This system was set up at the initiative of the Commission of the European Communities (Directorate-General for Science, Research and Development). It involves a series of medium term, macrosectoral econometric models in which energy plays a special role as a production factor. The different models are interlinked by a bilateral flow module, which describes for each product the trade between all the Community countries taken in twos. The United States, Japan and five zones are represented in this by simplified versions of the Commission's COMET model. This volume will help the reader to understand and interpret the numerous studies which have been undertaken with the help of the HERMES system.

Economists and researchers will find valuable information and figures, with a common nomenclature, on the economies of the different countries, both on structural data and on economic operators.

Econometric Business Cycle Research deals with econometric business cycle research (EBCR), a term introduced by the Nobel-laureate Jan Tinbergen for his econometric method of testing (economic) business cycle theories. EBCR combines economic theory and measurement in the study of business cycles, i.e., ups and downs in overall economic activity. We assess four methods of EBCR: business cycle indicators, simultaneous equations models, vector autoregressive systems and real business indicators. After a sketch of the history of the methods, we investigate whether the methods meet the goals of EBCR: the three traditional ones, description, forecasting and policy evaluation, and the one Tinbergen introduced, the implementation/testing of business cycles. The first three EBCR methods are illustrated for the Netherlands, a typical example of a small, open economy. The main conclusion of the book is that simultaneous equation models are the best vehicle for EBCR, if all its goals are to be attained simultaneously. This conclusion is based on a fairly detailed assessment of the methods and is not over-turned in the empirical illustrations. The main conclusion does not imply the end of other EBCR methods. Not all goals have to be met with a single vehicle, other methods might serve the purpose equally well - or even better. For example, if one is interested in business cycle forecasts, one might prefer a business cycle indicator or vector autoregressive system. A second conclusion is that many ideas/concepts that play an important role in current discussions about econometric methodology in general and EBCR in particular, were put forward in the 1930s and 1940s. A third conclusion is that it is difficult, if not impossible, to compare the outcomes of RBC models to outcomes of the other three methods, because RBC modellers are not interested in modelling business cycles on an observation-per-observation basis. A more general conclusion in this respect is that methods should adopt the same concept of business cycles to make them comparable.

This book covers application of food microbiology principles into food preservation and processing. Main aspects of the food preservation techniques, alternative food preservation techniques, role of microorganisms in food processing and their positive and negative features are covered. Features subjects on mechanism of antimicrobial action of heat, thermal process, mechanisms for microbial control by low temperature, mechanism of food preservation, control of microorganisms and mycotoxin formation by reducing water activity, food preservation by additives and biocontrol, food preservation by modified atmosphere, alternative food processing techniques, and traditional fermented products processing. The book is designed for students in food engineering, health science, food science, agricultural engineering, food technology, nutrition and dietetic, biological sciences and biotechnology fields. It will also be valuable to researchers, teachers and practising food microbiologists as well as anyone interested in different breeds of food. Defines and explains terms related to management, banking, finance, insurance, real estate, investment, data processing, marketing, and economic theory.
