The Theory and Practice of Integrated Health Approaches

This test broke ground with its thorough coverage of molecular physiology seamlessly integrated into a traditional homeostasis-based systems approach. This edition introduces a major reorganisation of the early chapters to provide the best foundation for the course and new art features that streamline review and essential topics so that students can access them more easily on an as-needed basis.

An up-to-date, self-contained introduction to a state-of-the-art machine learning approach, *Ensemble Methods: Foundations and Algorithms* shows how these accurate methods are used in real-world tasks. It gives you the necessary groundwork to carry out further research in this evolving field. After presenting background and terminology, the book covers the main algorithms and theories, including

Boosting, Bagging, Random Forest, averaging and voting schemes, the Stacking method, mixture of experts, and diversity measures. It also discusses multiclass extension, noise tolerance, error-ambiguity and bias-variance decompositions, and recent progress in information theoretic diversity. Moving on to more advanced topics, the author explains how to achieve better performance through ensemble pruning and how to generate better clustering results by combining multiple clusterings. In addition, he describes developments of ensemble methods in semi-supervised learning, active learning, cost-sensitive learning, class-imbalance learning, and comprehensibility enhancement. This edition features the exact same content as the traditional text in a convenient, three-hole-punched, loose-leaf version. Bayesian Modeling and Computation in Python aims to help beginner Bayesian practitioners to become intermediate modelers with a hands on approach with PyMC3, Tensorflow Probability, ArviZ and other libraries focusing on the practice of applied statistics with references to the underlying mathematical theory. The book starts with a refresher of the Bayesian Inference concepts. The first chapter introduces modern methods for Exploratory Analysis of Bayesian Models. With an understanding of these two fundamental concepts the subsequent chapters talk through various models including linear regressions, splines, time series, Bayesian additive regression trees. The final chapters include Approximate Bayesian Computation, end to end case studies showing how to apply Bayesian modelling in different settings, and a chapter about the internals of probabilistic programming languages. Finally the last chapter serves as a reference for the rest of the book by getting closer into mathematical aspects or by extending the discussion of the previous chapters. This book is written by contributors of PyMC3, ArviZ, Bambi, and Tensorflow Probability among other libraries.

This is the eBook of the printed book and does not include any media, website access codes, or print supplements that may be packaged with the bound book.
