For more than 50 years, the U.S. -- which accounts for half of global food aid supplies -- has played an important role in alleviating malnutrition and hunger, esp. during emergencies. In FY 2010, the U.S. spent \$1.5 billion on emergency food aid that reached 46.5 million beneficiaries. To preserve the nutritional value of food aid, quality controls are in place throughout the supply chain. This report assessed U.S. efforts to: (1) meet the nutritional needs of intended recipients; and (2) maintain the quality of commodities throughout the food aid supply chain. The auditor interviewed agency officials and their implementing partners, and conducted fieldwork in the U.S. and four countries in Africa. Charts and tables. This is a print on demand report.

Advanced Nutrition and Dietetics in Nutrition Support

Malnutrition and obesity are both common among Americans over age 65. There are also a host of other medical conditions from which older people and other Medicare beneficiaries suffer that could be improved with appropriate nutritional intervention. Despite that, access to a nutrition professional is very limited. Do nutrition services benefit older people in terms of morbidity, mortality, or quality of life? Which health professionals are best qualified to provide such services? What would be the cost to Medicare of such services? Would the cost be offset by reduced illness in this population? This book addresses these questions, provides recommendations for nutrition services for the elderly, and considers how the coverage policy should be approached and practiced. The book discusses the role of nutrition therapy in the management of a number of diseases. It also examines what the elderly receive in the way of nutrition services along the continuum of care settings and addresses the areas of expertise needed by health professionals to provide appropriate nutrition services and therapy.
