Recycling and Recycled Paper Procurement Update

Paper is one of the most important innovations ever created. Curious readers will learn about the processes that trees and recycled materials undergo before paper products like printer paper, cardboard, and tissues reach homes and classrooms, as well as exciting new applications for paper and pulp. This book describes interesting concepts like the global supply chain and the relationship between paper mills, retailers, and consumers. It explains how population growth in China affects the demand for paper, and summarizes the economic forecast for paper manufacturers.

With the exception of a slight hiccup during the height of the recent environmental movement (during the early 1990s), when for a year or two consumers were prepared to pay a price premium for lower quality recycled paper than for the virgin product, the inexorable improvement in the quality demanded of paper products continues. This demand for quality covers not only the aesthetics of the product but also its performance. Moreover, it is becoming increasingly the case that papers designed for a particular use must, as it were incidentally, also perform well in alternative applications. An example is that of office and printing papers, which are expected to perform as well in copier machines as in all the various forms of impact and non-impact printers. But even greater demands are made in other product areas, where board designed for dry foods can also be expected to protect moist and fatty materials and be made of 100% recycled fibre. The need to isolate foodstuffs from some of the contaminants that can affect recycled board is a serious challenge. Thus, papermakers are constantly striving to meet a broadening spectrum of demands on their products; often while accepting declining quality of raw materials. The product design philosophy that has arisen in response to this is increasingly to isolate the bulk of a paper from its uses: to engineer the needed performance characteristics into the paper surfaces while more or less ignoring what happens inside.

The Essential Guide

Paper is the largest single component of municipal solid waste, and the recycling of paper must be part of any resolution of the current garbage crisis. Because there are no uniform standards for the generic term "recycled," it is still difficult for consumers to make environmentally responsible purchasing decisions. Myths, misinformation, and confusion abound. This first comprehensive guide to recycled printing and writing papers will therefore be an invaluable resource for anyone involved in printing, production, design, or issues of recycling in general. The book itself, printed on four different types of recycled paper, is a demonstration of the quality that informed designers and publishers can achieve. In concise, nontechnical language, Claudia Thompson explains the dimensions of the solid waste problem, the history of papermaking, the elements of recycled paper production (including current definitions and standards), the physical properties and printing characteristics of recycled paper, the potential impact of designers on recycling, and possibilities for the future. *Recycled Papers: The Essential Guide* is sponsored by the American Institute of Graphic Arts under the direction of Claudia Thompson, a graphic designer and founder of Claudia Thompson Design in Cambridge, Massachusetts. Ms. Thompson's work on environmental issues started with her participation in Earth Day in 1970, and she has been researching the subject of recycled papers since 1988.

Recycling and Deinking of Recovered Paper

Paper recycling in an increasingly environmentally conscious world is gaining importance. Increased recycling activities are being driven by robust overseas markets as well as domestic demand. Recycled fibers play a very important role today in the global paper industry as a substitute for virgin pulps. Paper recovery rates continue to increase year after year. Recycling technologies have been improved in recent years by advances in pulping, flotation deinking and cleaning/screening, resulting in the quality of paper made from secondary fibres approaching that of virgin paper. The process is a lot more eco-friendly than the virgin-papermaking process, using less energy and natural resources, produce less solid waste and fewer atmospheric emissions, and helps to preserve natural resources and landfill space. Currently more than half of the paper is produced from recovered papers. Most of them are used to produce brown grades paper and board but for the last two decades, there is a substantial increase in the use of recovered papers to produce, through deinking, white grades such as newsprint, tissue, market pulp. By using recycled paper, companies can take a significant step toward reducing their overall environmental impacts. This study deals with the scientific and technical advances in recycling and deinking including new developments. Covers in great depth all the aspects of recycling technologies. Covers the latest science and technology in recycling. Provides up-to-date, authoritative information and cites many mills experiences and pertinent research. Includes the use of biotech methods for deinking, refining, and improving drainage.

Recycled Paper

Trash to Cash

If your company wants to save money currently spent on waste hauling, disposal, and clean-up costs, while protecting the environment, this is the book for you. Let Trash to Cash serve as your implementation guide to an effective, on-going corporate paper recycling and waste reduction program. Berman addresses the major issues and realities surrounding paper consumption and recycling. This prescriptive guide can show you how to achieve a financially successful

Where To Download Recycled Paper Products

program for your company. Fully illustrated, Trash to Cash contains practical and insightful case studies that demonstrate how successful programs have been created and kept alive at AT&T, McDonald's, Merrill Lynch and other role-model corporations. Learn how to be on target environmentally while saving your company thousands, even millions of dollars. Discover how a minor change to a paper bag saved McDonald's \$2.6 million in 1994. See how Giordano Paper Recycling Corporation saved a company \$50/ton in waste hauling fees and earn an \$80/ton recycling payment instead. We are in a crisis situation. Statistical evidence is everywhere and the message is loud and clear. Paper consumption, landfills, deforestation, lumber production, and population growth rates all have an impact. This book identifies specific techniques that work and shows how any large or medium sized organization can overcome obstacles to curbing consumption and to recycling. The detailed case examples demonstrate how various companies have overcome their crises and "closed the loop" by buying recycled products.
