The Group of Eight has become a central actor in global governance with a steadily expanding role and agenda. The leaders' summits remain at the apex of the G8 system, but the leaders' work is complemented by intensifying and expanding networks of ministerial fora as well as various task forces and expert groups. Some of these entities, initially launched by the leaders, have taken on a life of their own with an agenda that diverges from the main concerns of the summits. Following on from Hajnal's acclaimed book The G7/G8 System, this volume discusses the origins, characteristics, evolution, role and agenda of the G7 and G8 system, including a systematic survey of its components. It introduces the major debates about the G7 and G8, looks at proposals to reform the G8-G20 and provides a detailed study of the complex, elusive and changing patterns of documentation of the broader G8-G20 system, including electronic information.

Buffalo, in New York state, is 'ineffable': a typical city in transition between its past and future. It is a classic example of one of many 'shrinking cities' in North America and elsewhere which once prospered because of heavy industrialization, but which now have to deal with various degrees of urban decay. Bringing together a range of scho from the humanities, the social sciences, art and architecture, this volume looks at both the literal city image and urban representation generated by photographs, video, historical and contemporary narratives, and grass-root initiatives. It investigates the notion of agency of media in the city and, in return, what the city's agency is. This ag matters particularly as it is both transforming - shrinking, fading, being redefined - and being shaped through its visual and spatial mediation. While illustrated by Buffalo in particular, the book examines a broader phenomenon: the identity of those cities that were built and blossomed during the late 19th and early 20th century and are now in different stages of decline and disintegration. However, while such cities are all confronted with complex issues of economic instability, social and racial segregation, urban sprawl and shrinking processes both in the inner city and more and more in their ex-urban belts, they are too often described through dramatically simplifying visual and linguistic tropes. In Buffalo such tropes refer dialectically either to the city's past glory or its presumed current cultural, political and economical stasis and decline. This book takes such tired, and familiar tropes and questions them.

Symbols are essential to the documentation and communication of engineering ideas. This book presents the symbols and identifiers used for instrumentation and process control. It contains sample P&IDs and other drawings and examples of how to use symbols in different control schemes. ISAs symbol standards form the basis of the book. Readers will learn how to use symbols to convey details and operating relationships in the most efficient way. Chapters are organized by document type, following the typical work sequence of control systems engineering and design work. In addition to instrument and loop symbols, the book covers piping, electrical, logic, and process flow symbols and diagrams.

PRINCE2® Guidelines for writing Project Initiation Documentation

This document is written for educational purposes, for project managers who need to write a document with all agreements between the Project Board and the Project Manager. The PID, or Project Initiation Documentation is made during the Initiation Stage of a project, before actual design, development and delivery is being done. The document is one of the main documents in the PRINCE2® method and is comparable to the Project Charter or Project Definition Document.

John Carroll shows how a pervasive but underused element of design practice, the scenario, can transform information systems design. Difficult to learn and awkward to use, today's information systems often change our activities in ways that we do not need or want. The problem lies in the software development process. In this book John Carroll shows how a pervasive but underused element of design practice, the scenario, can transform information systems design. Traditional textbook approaches manage the complexity of the design process via abstraction, treating design problems as if they were composites of puzzles. Scenario-based design uses concretization. A scenario is a concrete story about use. For example: "A person turned on a computer; the screen displayed a button labeled Start; the person used the mouse to select the button." Scenarios are a vocabulary for coordinating the central tasks of system development—understanding people's needs, envisioning new activities and technologies, designing effective systems and software, and drawing general lessons from systems as they are developed and used. Instead of designing software by listing requirements, functions, and code modules, the designer focuses first on the activities that need to be supported and then allows descriptions of those activities to drive everything else. In addition to a comprehensive discussion of the principles of scenario-based design, the book includes in-depth examples of its application.

The shopping centre has become an established feature of urban structure over the past thirty years. Development of centres has been rapid and little attempt has been made to consider the development process and the problems caused by it. There is a growing awareness that centres are not always wholly beneficial to their host cities and that some public policy control is necessary. This book examines the shopping centre development process and analyses the control policies which have been taken and which are needed. It draws on material from throughout the developed world. First published 1985.
