What can practice management systems software do for a law practice? With the right system in place, a law firms and staff will have the ability to automatically route items, tasks, documents, and events to certain people based on their role in the case or matter, as well as manage deadlines, improve responsiveness to clients, reduce malpractice insurance rates, and boost overall productivity. The challenge is to find a program that best serves the needs of the firm.

The topic of the research reported here is direct user participation in the task-based development of interactive software systems. Building usable software demands understanding and supporting users and their tasks. Users are a primary source of usability requirements and knowledge, since users can be expected to have intimate and extensive knowledge of themselves, their tasks and their working environment. Task analysis approaches to software development encourage a focus on supporting users and their tasks while participatory design approaches encourage users' direct, active contributions to software development work. However, participatory design approaches often concentrate their efforts on design activities rather than on wider system development activities, while task analysis approaches generally lack active user participation beyond initial data gathering. This research attempts an integration of the strengths of task analysis and user participation within an overall software development process. This work also presents detailed empirical and theoretical analyses of what it is for users and developers to cooperate, of the nature of user-developer interaction in participatory settings. Furthermore, it makes operational and assesses the effectiveness of user participation in development and the impact of user-developer cooperation

on the resulting software product. The research addressed these issues through the development and application of an approach to task based participatory development in two real world development projects. In this integrated approach, the respective strengths of task analysis and participatory design methods complemented each other's weaker aspects.

Learn how to: § Select the best ERP software for your organization § Choose the most effective wrap around software to enhance the performance of an existing ERP system § Align software selection with business goals and objectives § Budget for the software and the hidden costs involved in its implementation At times a daring, maddening, and even frightening process, finding and implementing a suitable software package is never an easy task. The cost of the software package is often a fraction of the overall expense.

Unless carefully selected, a major software package implementation can consume a considerable amount of your organization's time and energy. An ill-informed purchase can cost your organization it's customers, dollars, and reputation. Maximizing Business Performance through Software Packages: Best Practices for Justification, Selection, and Implementation explores the business challenges involved in justifying, selecting, and implementing software packages. It contains practical advice and insights on how to select "good fitting" software packages, how to justify them in terms of their ability to enable business process change or improvement, and most importantly, how to implement them successfully. Selecting and implementing enterprise architecture technology software solutions involves a large expenditure across all the resources of an organization. The process has become increasingly complex as business functions have become increasingly

This book constitutes the thoroughly refereed post-proceedings of the 13th Agent-Oriented Software Engineering (AOSE) workshop, held at the 11th International Conference on Autonomous Agents and Multiagent Systems, AAMAS 2012, in Valencia, Spain, in June 2012. This volume presents 9 thoroughly revised papers selected from 24 submissions as well as two invited articles by leading researchers in the field. The papers cover a broad range of topics related to software engineering of agent-based systems, with particular attention to the integration of concepts and techniques from multi-agent systems with recent programming languages, platforms, and established software engineering methodologies.

Proposal Writing is a daunting task: we have to follow strict guidelines and a process we aren't familiar with. On top of that, we need to present our project in the best possible light, all within a very tight deadline. Doing everything, and doing it perfectly, is possible - but it requires time: time to read, to understand, to plan and to write. Time, unfortunately, is the resource we lack the most, and we might not be able to build the necessary expertise via practice. This is where I come in: I put my time in this book, so you don't have to waste yours. This book is a collection of the best, tools, tricks and techniques developed in 7+ years of grant writing. Every single tool or concept has been field tested and refined via trial and
