The Mises Institute is thrilled to bring back this popular guide to ridiculous economic policy from the ancient world to modern times. This outstanding history illustrates the utter futility of fighting the market process through legislation. It always uses despotic measures to yield socially catastrophic results. It covers the ancient world, the Roman Republic and Empire, Medieval Europe, the first centuries of the U.S. and Canada, the French Revolution, the 19th century, World Wars I and II, the Nazis, the Soviets, postwar rent control, and the 1970s. It also

includes a very helpful conclusion spelling out the theory of wage and price controls. This book is a treasure, and super entertaining!

This book presents the stylized facts on the important variables (output, inflation, money supply and interest rates, etc.) of the macro economy and uses them to differentiate how well particular economic theories perform or fail to do so. On the determination of aggregate demand, this book presents two approaches: the traditional IS-LM analysis under the assumption that the money supply is exogenous because the central bank uses its monetary policy to control it, and the emerging IS-IRT analysis under the assumption that the interest rate is the exogenous monetary policy variable set by the central bank to manipulate aggregate

demand in the economy. The IS-IRT analysis is important for the macro analyses of many economies, yet is totally neglected in most textbooks on macroeconomics. The chapter on Paradigms in Economics introduces students to the heritage of ideas in macroeconomics, and the evolution of ideas and approaches over the last two centuries. It also provides the justification for the simultaneous relevance of both Classical ideas and Keynesian ones. The two growth theory chapters go beyond the Solow growth model to cover the broad evolution of growth from Malthus's theory to the present endogenous approaches, and the link between money supply, inflation and growth over very long periods.

Price theory, often misleadingly labeled "microeconomics," is the explanation of how individual actors coordinate via markets, prices, and exchange to produce, distribute, and consume goods and services. Worked out more than a century ago, it remains the core of modern economic theory. This text, first published in 1986 and now combining material from the first two editions, emphasizes understanding over formal analysis, using verbal explanation to supplement mathematical argument. While

optional sections require an understanding of calculus, the central arguments do not. The theory, once worked out, is applied both to the conventional topics of the classroom and to less obviously economic features of human behavior-love, marriage, crime, politics."Although the range of behavior analyzed with the economic way of thinking has been greatly extended during the past several decades, textbooks on economic principles generally have taken a much narrower view of the scope of economics. This is not surprising since recent developments in a scientific field usually do not find

their way into textbooks for many years. Fortunately, several economics texts in recent years have begun to take a broader view, and this text by David Friedman does so in the most thoroughgoing and satisfactory manner of any that I have seen. Every chapter shows evidence of a skilled and imaginative economist applying his tools to the world around him."(From the forward by Gary Becker)

The book is written for active learners – those keen on cutting their own path through the complex and at times hardly comprehensible world of THEORY in International Relations. To aid this process as much as possible, this book employs the didactical and methodical concept of integrating teaching and self-study. The criteria for structured learning about IR theory will be derived from an extensive discussion of the questions

and problems of philosophy of science (Part 1). Theory of IR refers to the scientific study of IR and covers all of the following subtopics: the role and status of theory in the academic discipline of IR; the understanding of IR as a science and what a "scientific" theory is; the different assumptions upon which theory building in IR is based; the different types of theoretical constructions and models of explanations found at the heart of particular theories; and the different approaches taken on how theory and the practice of

international relations are linked to each other. The criteria for the structured learning process will be applied in Part 2 of the book during the presentation of five selected theories of International Relations. The concept is based on "learning through example" – that is, the five theories have been chosen because, when applying the criteria developed in Part 1 of the book, each single theory serves as an example for something deeply important to learn about THEORY of IR more generally.

This book provides a broad introduction to modern asset pricing theory. The theory is self-contained and unified in presentation. Both the no-arbitrage and the general equilibrium approaches of asset pricing theory are treated coherently within the general equilibrium framework. It fills a gap in the body of literature on asset pricing for being both advanced and comprehensive. The absence of arbitrage opportunities represents a necessary condition for equilibrium in the financial markets. However, the

absence of arbitrage is not a sufficient condition for establishing equilibrium.

These interrelationships are overlooked by the proponents of the no-arbitrage approach to asset pricing. This book also tackles recent advancement on inversion problems raised in asset pricing theory, which include the information role of financial options and the information content of term structure of interest rates and interest rates contingent claims. The inclusion of the proofs and derivations to enhance the transparency of

This involves discussing the work of Gardiner Means, Philip Andrews, and Michal Kalecki as well as the developers of the doctrines, such as Edwin Nourse, Paolo Sylos Labini, Harry Edwards, Josef Steindl and Alfred Eisner. Drawing upon the arguments and formal modelling offered by the
